THIRD AMENDED CONSENT DECREE

INTRODUCTION

A. On January 3, 1997, the Court entered a consent decree in this action (the “Asarco Tacoma Smelter Consent Decree”) providing for the cleanup by ASARCO Incorporated (“Asarco”) of the former Asarco Smelter and Slag Peninsula in Tacoma, Washington. The consent decree was entered into by the United States Environmental Protection Agency (“EPA”) and Asarco pursuant to the Comprehensive Environmental Response, Compensation and Liability Act (“CERCLA”), as amended, 42 U.S.C. § 9601 *et seq.*

B. On November 2, 2000, EPA and Asarco amended Section XX, Stipulated Penalties, of the Asarco Tacoma Smelter Consent Decree to add three new subparagraphs. The 2000 amendment (the “First Amendment”) to the Asarco Tacoma Smelter Consent Decree added significant stipulated penalties for Asarco’s failure to achieve specified milestone dates.

C. On July 14, 2000, EPA issued a Record of Decision (ROD) for Operable Unit 06, the Asarco Sediments/Groundwater Site, of the Commencement Bay Nearshore/Tideflats Superfund Site. Operable Unit 06 encompasses the groundwater under the Asarco Smelter, approximately 150 acres of offshore intertidal and subtidal lands, and the Yacht Basin formed by the Slag Peninsula, all located in Ruston and Tacoma, Pierce County, Washington.

D. On March 5, 2002, EPA issued a Unilateral Administrative Order for Remedial Design and Remedial Action, EPA Docket No. 10-2002-0046, requiring Asarco to perform the Remedial Design and Remedial Action (RD/RA) for Operable Unit 06, the Asarco Sediments/Groundwater Site.

E. In February 2003, a consent decree was entered in the matter of United States v. Asarco Incorporated and Southern Peru Holdings Inc., No. CV 02-2079-PHX-RCB (the “Arizona consent decree”). Among other provisions, the Arizona consent decree provided a temporary (three year) cap on the amount Asarco would have to spend on certain types of environmental obligations at sites around the country, including the Tacoma Smelter. The decree also temporarily suspended the imposition of certain types of stipulated penalties under

federal consent decrees, including the Asarco Tacoma Smelter Consent Decree, should certain types of deadlines established in those decrees not be met.

F. In February 2005, ASARCO Incorporated merged into a newly formed Delaware limited liability company, ASARCO LLC (“Asarco LLC”). Asarco LLC was the surviving entity of that merger, and assumed all the obligations of Asarco Incorporated, including those relating to the performance of the obligations of the Asarco Tacoma Smelter Consent Decree and amendments thereto.

G. On August 9, 2005, Asarco LLC filed for bankruptcy protection under chapter 11 of the bankruptcy code in the United States District Court for the Southern District of Texas (“Bankruptcy Court”).

H. On December 8, 2005, Asarco LLC entered into an agreement with MC Construction Consultants, Inc. (“MC Construction”), to sell approximately 97 acres of its real property (the “Purchased Property”) located in Tacoma and Ruston, Washington. The Purchased Property includes parts of the former Asarco Smelter Site, Operable Unit 02, and parts of the Asarco Sediments/Groundwater Site, Operable Unit 06.

I. Under the terms of the sale agreement (the “Tacoma Purchase Agreement”), MC Construction and EPA must reach agreement on remediation tasks associated with Operable Units 02 and 06. Paragraph 5.3 of the Tacoma Purchase Agreement states:

Prior to Closing and as promptly as it may be obtained, [MC Construction] shall provide [Asarco] with an instrument or document issued by the EPA...indicating approval of the transfer of the Liabilities, as such Liabilities relate to the environmental matters, that [MC Construction] will assume with respect to the Property indicating approval of [MC Construction’s] qualifications with respect to the transfer of such Liabilities....

J. On January 30, 2006, the Bankruptcy Court approved the sale of the Smelter Property to MC Construction. Paragraph 14 of the Sale Order provides that the Sale Order shall not become effective until:

(i) the EPA Lien Agreement is approved by the Bankruptcy Court; and (ii) the Buyer’s agreement with the EPA, as contemplated by Section 5.3 of the Agreement, has been approved and entered by the United States District Court for the Western District of Washington, Tacoma Division.

MC Construction subsequently assigned to Point Ruston, LLC (“Point Ruston”) its rights under the Tacoma Purchase Agreement. Point Ruston is a limited liability company incorporated in Washington, with its principal place of business in Ruston, Washington.

K. EPA entered into negotiations with Point Ruston for remediation of the Asarco Smelter Site, Operable Unit 02, and the Asarco Sediments/Groundwater Site, Operable Unit 06 (collectively referred to as the “Site”). This Third Amended Consent Decree embodies the entire agreement between EPA and Point Ruston for remediation of the Asarco Smelter Site, Operable Unit 02, and the Asarco Sediments/Groundwater Site, Operable Unit 06.

L. This Third Amended Consent Decree replaces the Second Amendment to the Asarco Tacoma Smelter Consent Decree (the “Second Amendment”), which the Court entered on October 23, 2006, and includes revisions to the Second Amendment.

M. From the time of lodging and entry of the Second Amendment through the date of this Third Amended Consent Decree Point Ruston has undertaken plans to develop the Purchased Property as a residential mixed-use neighborhood with the lower portion of the Purchased Property being developed with condominiums, apartments and other residential units along with commercial, retail, recreation, entertainment and public use facilities. Single-family dwellings have been developed only on the portion of the Purchased Property known as Stack Hill. Point Ruston plans to complete the redevelopment of the Site through the development of a residential mixed-use neighborhood. Through Point Ruston’s development of the Site approximately seven parcels of property and an area designated as a Materials Management Zone (“MMZ”) remain uncapped and require a final cap to be constructed. These seven parcels and the MMZ constitute the “Remaining Site Cap”, and are depicted on the map attached hereto as Appendix H.

N. Point Ruston represents that it is a Bona Fide Prospective Purchaser within the meaning of Section 101(40) of CERCLA, 42 U.S.C. § 9601(40), and intends to take all steps to maintain its status as Bona Fide Prospective Purchaser, and for purposes of this Third Amended Consent Decree EPA accepts this representation. Point Ruston represents, and for the purposes

of this Third Amended Consent Decree EPA relies on the representation, that Point Ruston has had no involvement with the Purchased Property or the Site and that Point Ruston has carried out all appropriate inquiries into the prior ownership and uses of the facility prior to purchasing the Purchased Property. EPA agrees that the Work to be performed by Point Ruston under this Third Amended Consent Decree is consistent with “taking reasonable steps,” within the meaning of Section 101(40) of CERCLA, 42 U.S.C. § 9601(40), to stop continuing releases, prevent threatened future releases, and prevent or limit human, environmental, or natural resources exposure to previous releases.

O. Point Ruston certifies that, to the best of its knowledge and belief, it fully and accurately disclosed to EPA all information known to Point Ruston, and all information in the possession or control of its officers, directors, contractors and agents which relates in any way to any Existing Contamination or any past or potential future release of hazardous substances, pollutants or contaminants at or from the Site, prior to purchasing the Purchased Property. Point Ruston also certifies that to the best of its knowledge and belief it did not cause or contribute to a release or threat of release of hazardous substances or pollutants or contaminants at the Site, prior to purchasing the Purchased Property. If the United States determines that information provided by Point Ruston in these certifications is not materially accurate and complete, this Third Amended Consent Decree, within the sole discretion of the United States, shall be null and void and the United States reserves all rights, and Point Ruston reserves all defenses, each may have.

P. On October 23, 2006, the Second Amendment , which among other things, added Point Ruston LLC as a Party, was entered by this Court.

Q. By Order of this Court on January 7, 2010, ASARCO LLC and ASARCO Incorporated were removed as parties to the Second Amendment.

R. Pursuant to Paragraph 70 of the Second Amendment EPA has previously submitted five bills for Oversight costs to Point Ruston which have not been paid in full. The identification number for these five bills are SN 2701026T200, SN 2701226T0034, SN

2701426S0006, SN 2701526S0009 and SN 270162S0020 ("Past Due Oversight Costs"). The United States contends that such bills have been incurring Interest in accordance with Paragraph 72 of the Second Amendment. On March 15, 2016, Point Ruston made a payment of \$750,000 in partial fulfillment of this obligation. Point Ruston's timely payments in accordance with Paragraph 69 of this Third Amended Consent Decree will resolve all claims of the United States' for Past Due Oversight Costs.

S. The Development Payout Agreement was attached as Exhibit C to the Amended and Restated Tacoma Purchase Agreement dated January 10, 2006. The United States contends that certain payments owed to the United States pursuant to paragraph 2 of the Development Payout Agreement are due and owing and have been incurring interest charges in accordance with the terms of the Development Payout Agreement ("Past Due DPA Claims"). Point Ruston's timely payments in accordance with Paragraph 69 of this Third Amended Consent Decree will resolve all claims of the United States' for amounts owing under the Development Payout Agreement.

I. BACKGROUND

1. The United States of America ("United States"), on behalf of the Administrator of the United States Environmental Protection Agency ("EPA"), filed a complaint in this matter pursuant to Sections 106 and 107 of the Comprehensive Environmental Response, Compensation, and Liability Act ("CERCLA"), 42 U.S.C. §§ 9606 and 9607, and Section 7003 of the Resource Conservation and Recovery Act ("RCRA"), 42 U.S.C. § 6973, against ASARCO Incorporated ("Asarco").

2. The United States in its complaint sought, inter alia: (a) reimbursement of costs incurred and to be incurred by EPA and the Department of Justice for response actions at the Asarco Tacoma Smelter Site ("Site") in Ruston and Tacoma, Washington, which is Operable Unit 02 within the Commencement Bay Nearshore/Tideflats Superfund Site (the "CB N/T site"), together with accrued interest; and (b) performance of studies and response work by Asarco at

the Site consistent with the National Oil and Hazardous Substance Pollution Contingency Plan, 40 C.F.R. Part 300 (as amended) ("NCP").

3. In accordance with the NCP and Section 121(f)(1)(F) of CERCLA, 42 U.S.C. § 9621(f)(1)(F), EPA notified the state of Washington (the "State") on June 30, 1995, of negotiations with Asarco regarding the implementation of the remedial design and remedial action for the Site and EPA has provided the State with an opportunity to participate in such negotiations and be a party to this Amended Consent Decree.

4. In accordance with Section 122(j)(1) of CERCLA, 42 U.S.C. § 9622(j)(1), EPA notified the federal, state, and Indian tribal natural resource trustees for the Site on June 30, 1995, of negotiations with Asarco regarding the release of hazardous substances that may have resulted in injury to the natural resources under their trusteeships and encouraged the trustees to participate in the negotiation of this Consent Decree. The natural resource trustees for the Site are: (a) the National Oceanic and Atmospheric Administration of the Department of Commerce, (b) the Department of the Interior, (c) the State of Washington Department of Ecology (on behalf of the Washington Departments of Fisheries, Natural Resources, and Wildlife), (d) the Puyallup Tribe of Indians, and (e) the Muckleshoot Indian Tribe (hereinafter collectively referred to as the "Natural Resource Trustees").

5. Point Ruston does not admit any liability to the Plaintiff arising out of the transactions or occurrences alleged in the complaint, nor does Point Ruston acknowledge that the release or threatened release of hazardous substance(s) at or from the Site constitutes an imminent or substantial endangerment to the public health or welfare or the environment.

6. Pursuant to Section 105 of CERCLA, 42 U.S.C. § 9605, EPA placed the Site on the National Priorities List, set forth at 40 C.F.R. Part 300, Appendix B, by publication in the Federal Register on September 8, 1983, 48 Fed. Reg. 40,658.

7. Because of the complexity of the CB/NT site, Superfund response actions at the CB/NT site are currently coordinated under multiple operable units managed primarily by EPA

and Ecology. This Consent Decree involves Operable Unit 02 -- Asarco Tacoma Smelter and certain portions of Operable Unit 06 -- Asarco Sediments.

8. Pursuant to an Administrative Order on Consent dated September 1986, Asarco agreed to perform immediate site stabilization activities at the Site and to conduct a Remedial Investigation and Feasibility Study ("RI/FS") of the Asarco Smelter and the surrounding area to determine the nature and extent of contamination and to evaluate alternatives for remediation of the Site.

9. Pursuant to a Consent Decree entered in *United States v. ASARCO Incorporated*, Civil NO. C91-5528 B, Western District of Washington, on May 19, 1992, Asarco agreed to conduct interim remedial actions at the Site including the demolition of most of the remaining structures. The requirements of that Consent Decree have been satisfied.

10. Pursuant to an Administrative Order on Consent for Ground Water, Surface Water, Soil and Marine Sediments Monitoring and Sampling, Docket No. 10-94-0221, as amended, Asarco agreed to conduct certain monitoring and sampling both on the Site and off-shore of the Site. The requirements of the Administrative Order have been satisfied. EPA issued a Record of Decision for subsurface groundwater and offshore sediments (the "OU6 ROD") on July 14, 2000.

11. Pursuant to Section 117 of CERCLA, 42 U.S.C. § 9617, EPA published notice of the completion of the RI, FS and of the proposed plan for remedial action on August 12, 1994, in a major local newspaper of general circulation. EPA provided an opportunity for written and oral comments from the public on the proposed plan for remedial action. A copy of the transcript of the public meeting is available to the public as part of the administrative record upon which the Regional Administrator based the selection of the response action.

12. The decision by EPA on the remedial action to be implemented at the Site is embodied in a final Record of Decision for Operable Unit 02 (the "OU2 ROD"), executed on March 24, 1995 (Appendix A), and in a final Record of Decision for Operable Unit 06 (the

“OU6 ROD”), executed on July 14, 2000. The state of Washington concurred on both the OU2 ROD and OU6 ROD.

13. INTENTIONALLY OMITTED

14. Based on the information presently available to EPA, EPA believes that the Work (as defined below) will be properly and promptly conducted by Point Ruston if conducted in accordance with the requirements of this Consent Decree and its appendices.

15. Solely for the purposes of Section 113(j) of CERCLA, 42 U.S.C. § 9613(j), the Remedial Action selected by the ROD and the Work to be performed by Point Ruston shall constitute a response action taken or ordered by the President.

16. Except as otherwise provided in this Consent Decree, in signing this Consent Decree, Point Ruston denies any and all legal and equitable liability and reserves all defenses under any federal, state, local or tribal statute, regulation or common law for any claim, endangerment, nuisance, response, removal, remedial or other costs or damages incurred or to be incurred by the United States, the State, or other entities or persons or any natural resource damages as a result of the release or threat of release of hazardous substances to, at, from or near the Site. Pursuant to 42 U.S.C. § 9622(d)(1)(B), entry of this Consent Decree is not an acknowledgement by Point Ruston that any release or threatened release of a hazardous substance constituting an imminent and substantial endangerment to human health or the environment has occurred or exists at the Site or the CB N/T site. Point Ruston does not admit and retains the right to controvert any of the factual or legal statements or determinations made herein in any judicial or administrative proceeding except in an action to enforce this Consent Decree or as provided in Paragraph 120. Point Ruston does agree, however, to the Court's jurisdiction over this matter. This Consent Decree shall not be admissible in any judicial or administrative proceeding against Point Ruston, over its objection, as proof of liability or an admission of any fact dealt with herein, but it shall be admissible in an action to enforce this Consent Decree.

17. The Parties recognize, and the Court by entering this Consent Decree finds, that this Consent Decree has been negotiated by the Parties in good faith and implementation of this Consent Decree will expedite the remediation of the Site and will avoid prolonged and complicated litigation between the Parties, and that this Consent Decree is fair, reasonable, and in the public interest.

NOW, THEREFORE, it is hereby Ordered, Adjudged, and Decreed:

II. JURISDICTION

18. This Court has jurisdiction over the subject matter of this action pursuant to 28 U.S.C. §§ 1331 and 1345, and 42 U.S.C. §§ 9606, 9607, and 9613(b). This Court also has personal jurisdiction over Point Ruston. Solely for the purposes of this Consent Decree, Point Ruston waives all objections and defenses that it may have to jurisdiction of the Court or to venue in this District. Point Ruston shall not challenge the terms of this Consent Decree or this Court's jurisdiction to enter and enforce this Consent Decree.

III. PARTIES BOUND

19. This Consent Decree applies to and is binding upon the United States and upon Point Ruston and its successors and assigns. Any change in ownership or corporate status of Point Ruston, including, but not limited to, any transfer of Point Ruston's assets or real or personal property, shall in no way alter Point Ruston's responsibilities under this Consent Decree.

20. Point Ruston shall provide a copy of this Consent Decree to each contractor hired to perform the Work (as defined below) required by this Consent Decree and to each person representing Point Ruston with respect to the Site or the Work and shall condition all contracts entered into hereunder upon performance of the Work in conformity with the terms of this Consent Decree. Point Ruston and its contractors shall provide written notice of the Consent Decree to all subcontractors hired to perform any portion of the Work required by this Consent Decree. Point Ruston shall nonetheless be responsible for ensuring that its contractors and subcontractors perform the Work contemplated herein in accordance with this Consent Decree.

With regard to the activities undertaken pursuant to this Consent Decree, each contractor and subcontractor shall be deemed to be in a contractual relationship with Point Ruston within the meaning of Section 107(b)(3) of CERCLA, 42 U.S.C. § 9607(b)(3).

IV. DEFINITIONS

21. Unless otherwise expressly provided herein, terms used in this Consent Decree which are defined in CERCLA or in regulations promulgated under CERCLA shall have the meaning assigned to them in CERCLA or in such regulations. Whenever terms listed below are used in this Consent Decree or in the appendices attached hereto and incorporated hereunder, the following definitions shall apply:

(a) "CC&Rs" shall mean the Declaration of Restrictive Covenants, Conditions, Restrictions, Reservations and Easements for Point Ruston, as such were recorded in partial satisfaction of the required institutional controls under the Second Amendment pursuant to Pierce County Auditor's Recording No. 201406100743 and re-recorded at 201605240809, as such may be amended pursuant to the terms contained therein.

(b) "Asarco" and "ASARCO Incorporated" means the New Jersey corporation of that name.

(c) "CERCLA" shall mean the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended, 42 U.S.C. §§ 9601 et seq.

(d) "Consent Decree" shall mean this Third Amended Consent Decree and all appendices attached hereto (listed in Section XXIX). In the event of conflict between this Decree and any appendix, this Decree shall control.

(e) Commencement Bay Nearshore/Tideflats Superfund site" ("CB N/T site") shall mean the area designated on the National Priorities List in September, 1983, as the CB N/T site, which is located at the southern end of the main basin of Puget Sound, near the City of Tacoma, Washington.

(f) "Contractor" or "subcontractor" means the company or companies retained by or on behalf of Point Ruston to undertake and accomplish the Work and associated activities required by this Consent Decree.

(g) "Day" shall mean a calendar day unless expressly stated to be a working day. "Working day" shall mean a day other than a Saturday, Sunday, or Federal holiday. In computing any period of time under this Consent Decree, where the last day would fall on a Saturday, Sunday, or Federal holiday, the period shall run until the close of business of the next working day.

(h) "Ecology" shall mean the State of Washington Department of Ecology and any successor departments or agencies of the State.

(i) "EPA" shall mean the United States Environmental Protection Agency and any successor departments or agencies of the United States.

(j) "Future Response Costs" shall mean all response costs, including, but not limited to, direct and indirect costs, that the United States incurs in reviewing or developing plans, reports and other items pursuant to this Consent Decree, verifying the Work, or otherwise implementing, overseeing, or enforcing this Consent Decree, including, but not limited to, payroll costs, contractor costs, travel costs, laboratory costs, the costs incurred pursuant to Sections VII, IX (including, but not limited to, attorneys fees and any monies paid to secure access and/or to secure institutional controls, including the amount of just compensation), XV, and Paragraph 102 of Section XXI.

(k) INTENTIONALLY OMITTED

(l) "Interest" shall mean interest at the rate specified for interest on investments of the Hazardous Substance Superfund established under Subchapter A of Chapter 98 of Title 26 of the U.S. Code, compounded on October 1 of each year in accordance with 42 U.S.C. § 9607(a), except with respect to Past Due Oversight Costs and Past Due DPA Claims, "Interest" shall mean interest at the rate specified in Paragraph 69.

(m) A Notice of Federal Lien (the "Lien") was recorded as Pierce County Auditor's Recording No. 200611140938 to provide constructive notice that the United States holds a lien on the lands and premises as described and as required by the Second Amendment in order to secure all obligations, including but not limited to, payment to the United States of all costs for which Point Ruston is liable to the United States under the Second Amendment and to secure the performance of Point Ruston under the Consent Decree (the "Notice of Lien").

(n) "National Contingency Plan" or "NCP" shall mean the National Oil and Hazardous Substances Pollution Contingency Plan promulgated pursuant to Section 105 of CERCLA, 42 U.S.C. § 9605, codified at 40 C.F.R. Part 300, and any amendments thereto.

(o) "On-site" shall mean the areal extent of contamination, which shall include but is not limited to, the Site and all suitable areas in very close proximity to the contamination necessary for implementation of the response action.

(p) "Operation and Maintenance" or "O & M" shall mean all activities required by the Statement of Work ("SOW") to maintain the effectiveness of the Remedial Action. "O & M Plan" shall mean the EPA approved Operation, Maintenance and Monitoring Plan For Smelter Site Cap, Slag Peninsula Cap, Shoreline Armoring and Utilities (June 2013), as such may be amended.

(q) "Paragraph" shall mean a portion of this Consent Decree identified by an arabic numeral or an upper case letter.

(r) "Parties" shall mean the United States and Point Ruston.

(s) INTENTIONALLY OMITTED

(t) "Performance Standards" shall mean the remediation standards and other measures of achievement of the goals of the Remedial Action set forth in Section 9.9 of the ROD and the SOW. Performance Standards shall not include the preliminary remediation goals for Class III groundwater set forth in Table 9-2 of the ROD. "Performance Standards" shall also include the Remedial Action Objectives in the OU 6 ROD that apply to the Nearshore/Offshore

Sediments, the “performance standards” in the SOW, and performance standards in the Final Design Report for Sediment Cap: Marine Sediments and Groundwater (December 2002) (“Final Design Report for Sediment Cap”) approved by EPA.

(u) "Plaintiff" shall mean the United States.

(v) "RCRA" shall mean the Solid Waste Disposal Act, as amended, 42 U.S.C. §§ 6901 et seq. (also known as the Resource Conservation and Recovery Act).

(w) "Record of Decision" or "ROD" shall mean the EPA Record of Decision for Operable Unit 02, to the Asarco Tacoma Smelter Facility signed on March 24, 1995, by the Regional Administrator, EPA Region 10, and all attachments thereto, and shall also mean the EPA Record of Decision for Operable Unit 06 of the CB N/T site, signed on July 14, 2000, by the Regional Administrator, EPA Region 10, and all attachments thereto (“OU6 ROD”).

(x) "Remedial Action" shall mean those activities, except for Operation and Maintenance, to be undertaken by Point Ruston to implement the ROD, in accordance with the SOW and final Remedial Design and Remedial Action Work Plans, Construction Management Plans, and other Plans approved by EPA. “Remedial Action” shall not include activities completed by Asarco as described in the SOW, unless EPA determines that Performance Standards applicable to such activities have not been met. However, with respect to OU6, “Remedial Action” shall mean the following activities to be undertaken by Point Ruston in accordance with the ROD, SOW and the Final Design Report for Sediment Cap: capping the Nearshore/Offshore sediments area as specified in the Operable Unit 06 ROD; dredging shallow sediments in the Yacht Basin, as described in the SOW; long-term monitoring of groundwater, as described in the SOW; monitoring the Nearshore/Offshore sediment cap post-construction to confirm that it remains in place, continues to isolate the underlying contaminated sediments and does not become recontaminated; and using institutional controls to prevent activities that damage the cap. “Remedial Action” also includes installation of a temporary cap, as described in the SOW, prior to public access or occupancy on any portion of the Purchased Property, unless otherwise approved by EPA, and any activity taken pursuant to Paragraph 31.h.

(y) "Remedial Action Work Plan" shall mean the document(s) developed by Point Ruston pursuant to Paragraph 31 of this Consent Decree and approved by EPA, and any amendments thereto.

(z) "Remedial Design" shall mean final plans and specifications for the Remedial Action (1) prepared by Asarco and approved by EPA or (2) prepared by Point Ruston and approved by EPA or (3) prepared by Asarco, amended by Point Ruston, and approved by EPA pursuant to Paragraph 30 of this Consent Decree, whichever is most recent.

(aa) INTENTIONALLY LEFT BLANK.

(bb) "Remedial Design Work Plan" shall mean the document(s) developed pursuant to Paragraph 30 of the Asarco Tacoma Smelter Consent Decree and approved by EPA, and any amendments thereto.

(cc) "Section" shall mean a portion of this Consent Decree identified by a roman numeral.

(dd) "Site" for purposes of this Consent Decree, shall mean the Asarco smelter facility which is approximately sixty-seven (67) acres in size, located in Ruston and Tacoma, Washington, and the adjacent slag peninsula which is approximately twenty-three acres in size, and all suitable areas in very close proximity to the facility that are necessary for implementation of this Remedial Action, except that the Site does not include subsurface groundwater and offshore sediments. "Site" shall also mean OU6, consisting of the approximately 150 acres of sediments offshore of the Tacoma Smelter Site, the Yacht Basin and the groundwater underneath the Tacoma Smelter Site. Appendix E to this Consent Decree depicts the "Site" as that term applies to Point Ruston.

(ee) "State" shall mean the state of Washington.

(ff) "Statement of Work" or "SOW" shall mean the document attached to this Consent Decree as Appendix F, and any amendments thereto.

(gg) "Supervising Contractor" shall mean the principal contractor retained by Point Ruston to supervise and direct the implementation of the Work under this Consent Decree.

(hh) "United States" shall mean the United States of America.

(ii) "Waste Material" shall mean (i) any "hazardous substance" under Section 101(14) of CERCLA, 42 U.S.C. § 9601(14); (ii) any pollutant or contaminant under Section 101(33), 42 U.S.C. § 9601(33); (iii) any "solid waste" under Section 1004(27) of RCRA, 42 U.S.C. § 6903(27); and (iv) any "dangerous waste" under Washington Administrative Code, Chapter 173-303.

(jj) "Work" shall mean all activities Point Ruston is required to perform under this Consent Decree, except those required by Section XXV (Retention of Records).

(kk) "Work Plans" shall mean the documents submitted by Point Ruston and approved by EPA as required under Section VI below.

(ll) "Phase" shall mean a portion of the Remedial Action to be performed in a discrete geographic area of the Site, as approved by EPA pursuant to Paragraph 31 of the Asarco Tacoma Smelter Consent Decree as modified by Paragraph 30 of this Consent Decree.

(mm) "OU6 ROD" shall mean the EPA Record of Decision for Operable Unit 06 of the CB N/T site, signed on July 14, 2000, by the Regional Administrator, EPA Region 10, and all attachments thereto.

(nn) "Bona Fide Prospective Purchaser" or "BFPP" shall mean a person described in CERCLA § 101(40).

(oo) "Existing Contamination" shall mean:

(1) any hazardous substances, pollutants or contaminants present or existing on or under the portion of the Site that is not within the definition of Purchased Property, or present or existing on or under those portions of the Purchased Property located within OU6, as of the effective date of the Second Amendment;

(2) any hazardous substances, pollutants or contaminants that migrated from the portion of the Site that is not within the definition of Purchased Property, or migrated from those portions of the Purchased Property located within OU6, prior to the effective date of the Second Amendment; and

(3) any hazardous substances, pollutants or contaminants presently at the Site that migrate onto or under or from the portion of the Site that is not within the definition of Purchased Property, or that migrate onto or under or from those portions of the Purchased Property located within OU6, after the effective date of the Second Amendment.

V. GENERAL PROVISIONS

22. Objectives of the Parties. The United States and Point Ruston agree that the objectives of the parties in entering into this Third Amended Consent Decree are: (a) to protect public health, welfare, and the environment by the design and implementation of response actions at the Site by Point Ruston; (b) to reimburse certain response costs of the Plaintiff, as set forth herein; (c) to settle and resolve, subject to the reservations in Paragraph 101 of this Consent Decree, the potential liability of Point Ruston under CERCLA and RCRA as provided in this Consent Decree; and (d) update and supersede the terms of the Second Amendment.

23. Approval of SOW. The United States has reviewed and approved the SOW, attached hereto, and has found it consistent with the ROD, the NCP and the requirements of relevant EPA remedial design guidance documents.

24. Commitments by Point Ruston. Point Ruston shall finance and perform the Work in accordance with this Consent Decree, the ROD, the SOW, and all work plans and other plans, standards, specifications, and schedules set forth herein or developed by Point Ruston and approved by EPA pursuant to this Consent Decree, or which were previously approved under the Second Amendment. Point Ruston shall reimburse the United States as provided in Paragraph 69 and for Future Response Costs as provided in Paragraph 70 of this Consent Decree.

25. INTENTIONALLY OMITTED

26. Compliance With Applicable Law. All activities undertaken by Point Ruston pursuant to this Consent Decree shall be performed in accordance with the requirements of all applicable federal and state laws and regulations. Point Ruston must also comply with all applicable or relevant and appropriate requirements of all federal and state environmental laws as

set forth in the ROD and the SOW. The activities conducted pursuant to this Consent Decree, if approved by EPA, shall be considered to be consistent with the NCP.

27. Permits.

a. As provided in Section 121(e) of CERCLA and § 300.400(e) of the NCP, no permit shall be required for any portion of the Work conducted entirely "on-site," as defined in Section IV (Definitions). Where any portion of the Work that is not on-site requires a federal or state permit or approval, Point Ruston shall submit timely and complete applications and take all other actions necessary to obtain all such permits or approvals.

b. Point Ruston may seek relief under the provisions of Section XVIII (Force Majeure) of this Consent Decree for any delay in the performance of the Work resulting from a failure to obtain, or a delay in obtaining, any permit required for the Work.

c. This Consent Decree is not, and shall not be construed to be, a permit issued pursuant to any federal or state statute or regulation.

28. Notice of Obligations to Successors-in-Title.

a. Each deed, title, or other instrument conveying an interest in any property owned by Point Ruston and included in the Site shall contain a notice stating that the property is subject to this Consent Decree and shall reference the recorded location of the Consent Decree and any restrictions applicable to the property under this Consent Decree. Point Ruston and EPA hereby agree that (i) the obligations of Point Ruston to the United States under this Third Amended Consent Decree shall be secured by the Lien, (ii) the recordation of the Notice of Lien shall serve as constructive notice of each and every obligation of Point Ruston hereunder, (iii) the Lien created under the Second Amendment and the Lien created under this Third Amended Consent Decree shall be one and the same, and (iv) no additional document or notice needs to be filed or recorded in order to establish that Point Ruston's obligations under this Third Amended Consent Decree remain secured by the Lien as an encumbrance on the Purchased Property.

b. The obligations of Point Ruston with respect to the provision of access and the implementation of institutional controls under Section IX (Access and Institutional Controls) shall be binding upon any and all persons who subsequently acquire such interest or portion thereof (hereinafter "Successors-in-Title"). "Successor-in-Title" includes, but is not limited to, a condominium association formed under RCW 64.34, but shall not mean unit owners as defined in RCW 64.34.020(32) or persons who acquire only an interest in any portion of Stack Hill. In addition to the requirement that any obligation of Point Ruston regarding Section IX (Access and Institutional Controls) be binding upon any Successor-in-Title, any Successor-in-Title must also assume and be bound by any O&M obligations existing under this Consent Decree. Absent EPA written consent to the contrary, the obligations to be assumed by any Successor-in-Title relates to the entire Purchased Property even if that successor is acquiring less than the entire Purchased Property. In addition, the obligations of Point Ruston with respect to the provision of access and the implementation of institutional controls under Section IX (Access and Institutional Controls) of this Consent Decree shall be binding on persons who acquire an interest in any portion of Stack Hill, but such obligations shall relate solely to Stack Hill, and not to the entire Purchased Property. After the entry of the Second Amendment, Point Ruston recorded at the Recorder's Office, Pierce County, state of Washington, a notice of obligation to provide access under Section IX and related covenants, if any. Each subsequent instrument conveying an interest to any such property owned by Point Ruston and included in the Site shall reference the recorded location of such notice and covenants applicable to the property.

c. Point Ruston and any Successor-in-Title shall, at least thirty (30) days prior to the conveyance of such interest, give written notice of this Consent Decree to the grantee and written notice to EPA of the proposed conveyance, including the name and address of the grantee, and the date on which notice of the Consent Decree was given to the grantee. In the event of any such conveyance, Point Ruston's obligations under this Consent Decree, including the obligations to provide or secure access pursuant to Section IX, shall continue to be met by Point Ruston. In addition, if the United States approves, the grantee may perform some or all of

the Work under this Consent Decree. In no event shall the conveyance of an interest in property that is owned by Point Ruston within the Site release or otherwise affect the liability of Point Ruston to comply with the Consent Decree.

VI. PERFORMANCE OF THE WORK BY POINT RUSTON

29. Selection of Supervising Contractor.

a. All aspects of the Work to be performed by Point Ruston pursuant to Sections VI (Performance of the Work by Point Ruston), VII (Remedy Review), and VIII (Quality Assurance, Sampling and Data Analysis) of this Consent Decree shall be under the direction and supervision of the Supervising Contractor, the selection of which shall be subject to disapproval by EPA. To date, EPA has approved the appointment of Point Ruston as the Supervising Contractor. No less than fifteen (15) days prior to the appointment of another Supervising Contractor, Point Ruston shall notify EPA, in writing, of the name, title, and qualifications of any contractor proposed to be the Supervising Contractor. EPA will issue a notice of disapproval or an authorization to proceed. If at any time thereafter, Point Ruston proposes to change a Supervising Contractor, Point Ruston shall give such notice to EPA and must obtain an authorization to proceed from EPA, before the new Supervising Contractor performs, directs, or supervises any Work under this Consent Decree.

b. If EPA disapproves a proposed Supervising Contractor, EPA will notify Point Ruston in writing. Point Ruston shall submit to EPA a list of contractors, including the qualifications of each contractor, that would be acceptable to them within thirty (30) days of receipt of EPA's disapproval of the contractor previously proposed. EPA will provide written notice of the names of any contractor(s) that it disapproves and an authorization to proceed with respect to any of the other contractors. Point Ruston may select any contractor from that list that is not disapproved and shall notify EPA of the name of the contractor selected within twenty-one (21) days of EPA's authorization to proceed.

c. If EPA fails to provide written notice of its authorization to proceed or disapproval as provided in this Paragraph and this failure prevents Point Ruston from meeting

one or more deadlines in a plan approved by the EPA pursuant to this Consent Decree, Point Ruston may seek relief under the provisions of Section XVIII (Force Majeure) hereof.

30. Remedial Design. Point Ruston has already received certain EPA approvals associated with the Remedial Design. Point Ruston shall meet the requirements for the Remedial Action specified in the RODs, the SOW and all Remedial Designs approved by EPA. Point Ruston shall submit plans and specifications for the remaining OU2 remediation tasks, and for any OU6 remediation tasks required by this Consent Decree, and shall submit them to EPA for review and approval. Upon their approval by EPA, the Remedial Designs shall be incorporated into and become enforceable under this Consent Decree. A Remedial Design will be submitted as part of any Construction Management Plan (“CMP”).

a. Within 60 days after EPA’s issuance of an authorization to proceed pursuant to Paragraph 29 of this Decree, Point Ruston shall submit to EPA and the State a schedule for preparation of CMPs for the remainder of the Work at the site.

b. Point Ruston shall submit to EPA and the State all CMPs and other remedial design deliverables in accordance with the approved schedule for review and approval pursuant to Section XI (EPA Approval of Plans and Other Submissions) of this Consent Decree.

c. Point Ruston may submit to EPA, for approval, one or more CMPs allowing for the Remedial Action to be performed in Phases. Separate CMPs may be prepared for the Phases of the sediment cap, the Slag Peninsula, and for work in the Yacht Basin, or they may be incorporated into another of the addenda. Each CMP shall include a description of the work to be performed including applicable Performance Standards, construction quality assurance standards, plans and specifications, remedial action work plan and schedule. The CMP must include detailed information on how the Phase will be integrated with adjacent Phases. Approval of the CMP shall be within the discretion of EPA, subject to dispute resolution under Section XIX. In determining whether or not to approve the CMP for a particular Phase EPA shall consider:

* Whether the CMP is consistent with the RODs and the SOW;

* Whether the CMP provides adequate protections regarding all other portions of the Site;

* Whether the CMP is consistent with an orderly, integrated and efficient implementation of the Remedial Action as a whole;

* Point Ruston's prior compliance with the terms of the Consent Decree and its prior performance of Work as that may be related to the effective achievement of the Performance Standards or other goals of the Consent Decree; and

* Any other factor related to the effective achievement of the Performance Standards or other goals of the Consent Decree.

d. Construction Management Plans shall meet the requirements specified for the Remedial Action in the RODs, the SOW, and include the Remedial Design, specifications, Remedial Action Work Plan, and schedule.

e. Construction Management Plans for each Phase of Remedial Action shall be completed by Point Ruston and approved by EPA before fieldwork begins on that Phase.

31. Remedial Action.

a. Point Ruston shall meet the requirements specified for the Remedial Action in the RODs, the SOW and all CMPs and Remedial Designs approved by EPA. Point Ruston shall implement the CMPs approved by EPA. Point Ruston shall implement the Construction Health and Safety Plan for the Site, which conforms to the applicable Occupational Safety and Health Administration and EPA requirements including, but not limited to, 29 C.F.R. §1910.120.

b. Point Ruston shall prepare CMPs for the Remedial Action, which may include a schedule for implementation of the Remedial Action in Phases, pursuant to Paragraph 30.c above. In addition, for each Phase a separate CMP will be prepared unless Phases are being constructed concurrently in which case one CMP for these Phases may be prepared. Each CMP shall include a description of the work to be performed, and a schedule for performing all Remedial Action required in that Phase.

c. After a reasonable opportunity for review and comment by the State, and upon EPA approval of the CMP, related documents, and the schedule, Point Ruston shall implement the Remedial Action described in the SOW. Point Ruston shall submit to EPA and the State all plans, submittals, or other deliverables required under the approved Remedial Action Work Plan in accordance with the approved schedule for review and approval pursuant to Section XI (EPA Approval of Plans and Other Submissions) of the Consent Decree. Unless otherwise directed by EPA, Point Ruston shall not commence physical Remedial Action activities at the Site prior to approval of the CMP.

d. The following deadlines shall apply:

(i) Point Ruston shall complete excavation of the shallow sediments in the Yacht Basin per the requirements of the SOW and the approved CMP prior to October 31, 2017.

(ii) Point Ruston shall submit a groundwater monitoring plan on or before June 15, 2016, and will begin monitoring within 30 days after EPA's approval of the plan.

(iii) Attached as Appendix H to this Consent Decree is a map identifying seven parcels of property and the Materials Management Zone ("MMZ"), referred to as the Remaining Site Cap, which still require the installation of a permanent cap. Point Ruston shall install permanent caps per the requirements of the SOW and the approved CMP as follows: three of the these parcels shall have a completed cap no later than December 31, 2017, an additional three of the seven parcels shall have a completed cap no later than December 31, 2018, and, the seventh parcel (and any other remaining uncapped properties except the MMZ) shall have a completed cap no later than December 31, 2019. Unless it is subject to an approved CMP, the MMZ shall have a completed cap no later than December 31, 2020. The CMPs for this work, which will include the identification of which parcels will be subject to this construction, must be approved 30 days prior to the start of construction.

e. Point Ruston shall continue to implement the Remedial Action and O & M until the Performance Standards are achieved and for so long thereafter as is otherwise required under this Consent Decree.

f. Notwithstanding any other provision of this Consent Decree (except for Paragraph 101), after Point Ruston completes construction of the sediment cap required in a Phase and EPA issues a Certification of Completion for that Phase, Point Ruston shall no longer be required to meet Performance Standards with respect to the capped sediments (including making repairs to correct the effects of recontamination, settling, subsidence, erosion, physical disturbances, or other forces); *provided however*, that if the sediment cap does not meet Performance Standards at the completion of the Remedial Action, then EPA may withdraw its Certification(s) of Completion for the cap until either (i) Point Ruston demonstrates that its actions were not responsible for the cap no longer meeting Performance Standards, or (ii) Point Ruston takes those actions necessary to again meet Performance Standards.

g. As to the deadlines set forth in Paragraph 31.d(iii), Point Ruston may request that such deadlines be extended due to the upcoming development of a parcel of property. In making this request Point Ruston shall specify which specific deadline in Paragraph 31.d(iii) it seeks to extend for the parcel of property. EPA shall consider such an extension only if Point Ruston has established: (a) that the temporary cap for that parcel is in place and functioning properly; (b) that financing is secured to fund the development and complete a permanent capping of that parcel; (c) that Point Ruston has agreed to a date by which the temporary cap will be replaced with a permanent cap; (d) that Point Ruston has provided EPA with detailed construction drawings and schedules of work that reflect the certainty of the development for that parcel occurring as presented and within the proposed deadlines; and, (e)

that Point Ruston is current on its payment obligations under Paragraph 69 following entry of this Amended Consent Decree. EPA approval of any changes to the deadlines in Paragraph 31.d(iii) based on the submission described in this Paragraph will be at its sole and unreviewable discretion. Moreover:

- A. EPA's approval of the extension will contain interim remedial action activity deadlines and Point Ruston shall be liable for stipulated penalties as provided in Paragraph 87(b)(vi) for failure to comply with any interim or final deadline and may also be required to proceed with reestablishment of the permanent cap on the parcel,
- B. Point Ruston must propose an extension no later than one year prior to the deadlines established in 31.d(iii) and,
- C. It is anticipated by the Parties, but not a requirement of this Amended Consent Decree, that any request for an extension to a deadline in Paragraph 31.d(iii) will be made at the same time Point Ruston submits a CMP for the parcel that is subject to an extension request for EPA approval.

h. The Parties recognize that Point Ruston may wish to pursue development on portions of the Site where the Remedial Action has already been certified as complete pursuant to Paragraph 65 of the Decree, and that such work may breach or negatively affect the integrity of an existing permanent cap.

- A. Prior to undertaking any work that risks breaching any portion of the permanent cap, Point Ruston shall propose a Post-Completion Construction Management Plan ("PC-CMP") which includes all elements of a Construction Management Plan. Notwithstanding the foregoing, any O & M work being conducted in accordance with the

O & M Plan shall not require any other approval, including but not limited to a PC-CMP, unless otherwise required by the O & M Plan.

B. In addition, for each parcel of property where work is proposed post-certification of completion, a separate PC-CMP will be prepared unless post-certification of completion work for one or more parcels is being done concurrently, in which case one PC-CMP may be prepared.

C. Approval of the PC-CMPs will be within the discretion of EPA, subject to dispute resolution under Section XIX. In determining whether or not to approve a PC-CMP EPA shall consider:

- * Whether the PC-CMP as proposed is consistent with the requirements of the RODs and the SOW;

- * Whether the PC-CMP as proposed provides adequate protections regarding all other portions of the Site;

- * Whether Point Ruston is prepared to provide the financial assurances, described in Paragraph 31(h)(D), acceptable to EPA;

- * Whether the PC-CMP as proposed is consistent with an orderly, integrated and efficient implementation of the Remedial Action as a whole;

- * Point Ruston's prior compliance with the terms of the Consent Decree and its prior performance of Work as that may be related to the effective achievement of the Performance Standards or other goals of the Consent Decree; and

- * Any other factor related to the effective maintenance or achievement of the Performance Standards or other goals of the Consent Decree.

D. Point Ruston shall submit to EPA a written estimate of the costs that may be incurred to secure the re-establishment of the Remedial Action on the parcel(s) of property on which Point Ruston has proposed a PC-CMP. This estimate must also include the potential costs EPA might incur should it be required to take over completion of the work should the work be left not completed. EPA shall review those estimates and make its determination as to the necessary level of financial security for each proposed PC-CMP. Point Ruston shall establish financial security in the amount of the approved cost estimate for that PC-CMP, and shall deposit the financial security documents into Escrow with Chicago Title Company or any other mutually agreed-to Escrow agent. The commencement of any Work Takeover pursuant to Paragraph 102 of the Consent Decree shall trigger EPA's right to receive the benefit of any financial security mechanisms provided in this Paragraph and at such time EPA shall have immediate access to resources guaranteed under any such mechanism whether in cash or in kind. EPA may use the funds from the financial security to complete the Remedial Action in the applicable PC-CMP. Financial security shall be established, at Point Ruston's election, in one or more of the following forms:

1. A surety bond unconditionally guaranteeing payment and/or performance of Remedial Action in the applicable PC-CMP;
2. One or more irrevocable letters of credit, payable to or at the direction of EPA, in the amount of the approved cost estimate for the Remedial Action in the applicable PC-CMP;
3. A trust fund established for the benefit of EPA in the amount of the approved cost estimate for the Remedial Action in the applicable PC-CMP;

4. A policy of insurance in the amount of the approved cost estimate for the Remedial Action in the applicable PC-CMP that provides EPA with acceptable rights as a beneficiary;
5. A demonstration by Point Ruston that it meets the financial test criteria of 40 C.F.R. § 264.143(f) with respect to the approved cost estimate for the Remedial Action in the applicable PC-CMP, provided that all other requirements of 40 C.F.R. § 264.143(f) are satisfied; or
6. Any other form of financial security as may be mutually agreed upon by Point Ruston and EPA.

Point Ruston shall maintain the financial security until EPA provides a Certification of Completion with respect to the applicable PC-CMP, as provided in Paragraph 65 of the Consent Decree.

32. Modification of the SOW, Related Work Plans or Related CMPs.

a. If EPA determines that modification to the work specified in the SOW, in work plans and/or CMPs developed pursuant to the SOW is necessary to achieve and maintain the Performance Standards or to carry out and maintain the effectiveness of the remedy set forth in the ROD, EPA may require that such modification be incorporated in the SOW and/or such plans. Provided, however, that a modification may only be required pursuant to this Paragraph to the extent that it is consistent with the scope of the remedy selected in the ROD.

b. For the purposes of this Paragraph 32 and Paragraphs 65 and 66 only, the "scope of the remedy selected in the ROD" is: excavation of source area soils on the Site; disposal of source area soils and demolition debris designated as hazardous waste in an on-site containment facility that meets or exceeds regulatory standards for hazardous waste landfills; capping of the entire Site with a low permeability cap; incorporation of site infrastructure into design and construction of the cap to the extent practicable (e.g, sewers, electrical lines, other utilities and roads); demolition of the remaining buildings and structures on the portion of the

Site owned by Point Ruston; replacement of the entire surface water drainage system and evaluation of surface water treatment if surface water goals are not met; diversion of ground water and off-site surface water; armoring of portions of the plant site and slag peninsula shoreline as necessary to control erosion; development and implementation of a mitigation plan to compensate for shoreline armoring activities or impacts to wetlands if such activities or impacts result in unacceptable adverse impacts to habitat; continued monitoring of surface water and ground water at the Site; and development and implementation of an enforceable program of restrictions and guidelines to supplement the actual remediation activities to ensure that the remedial action remains protective and that development activities do not impact the long-term effectiveness of the remediation. Remediation of subsurface groundwater is specifically excluded from the scope of the remedy for purposes of this Consent Decree. The "scope of the remedy selected in the ROD" also includes response actions in the following portions of OU 6: 1) Nearshore/Offshore sediments area for which the OU 6 ROD called for capping, and 2) shallow sediments in the Yacht Basin as described in the SOW. Such response actions shall include the following activities to be undertaken by Point Ruston in accordance with the ROD, SOW and the final Remedial Design and Remedial Action Work Plans approved by EPA: capping the Nearshore/Offshore sediments area as specified in the Operable Unit 06 ROD; dredging shallow sediments in the Yacht Basin, as described in the SOW; long-term monitoring of groundwater; monitoring the Nearshore/Offshore sediment cap post-construction to confirm that it remains in place, continues to isolate the underlying contaminated sediments and does not become recontaminated; and using institutional controls to prevent activities that damage the cap.

c. If Point Ruston objects to any modification determined by EPA to be necessary pursuant to this Paragraph, it may seek dispute resolution pursuant to Section XIX (Dispute Resolution), Paragraph 83 (record review). The SOW, related work plans, and/or CMPs shall be modified in accordance with final resolution of the dispute.

d. Point Ruston shall implement any work required by any modifications incorporated in the SOW, in work plans, and/or CMPs, developed pursuant to the SOW in accordance with this Paragraph.

e. Nothing in this Paragraph shall be construed to limit EPA's authority to require performance of further response actions as otherwise provided in this Consent Decree.

33. Point Ruston acknowledges and agrees that nothing in this Consent Decree, the SOW, or the Remedial Design, the Remedial Action Work Plans, and/or the CMPs, constitutes a warranty or representation of any kind by Plaintiff that compliance with the work requirements set forth in the SOW and the plans will achieve the Performance Standards. Point Ruston's compliance with the work requirements shall not foreclose Plaintiff from seeking compliance with all terms and conditions of this Consent Decree, including, but not limited to, the applicable Performance Standards.

34. Point Ruston shall, prior to any off-Site shipment of Waste Material from the Site to an out-of-state waste management facility, provide written notification to the appropriate state environmental official in the receiving facility's state and to the EPA Project Coordinator of such shipment of Waste Material. However, this notification requirement shall not apply to any off-Site shipments when the total volume of all such shipments will not exceed 10 cubic yards.

a. Point Ruston shall include in the written notification the following information, where available: (i) the name and location of the facility to which the Waste Material is to be shipped; (ii) the type and quantity of the Waste Material to be shipped; (iii) the expected schedule for the shipment of the Waste Material; and (iv) the method of transportation. Point Ruston shall notify the state in which the planned receiving facility is located of major changes in the shipment plan, such as a decision to ship the Waste Material to another facility within the same state, or to a facility in another state.

b. The identity of the receiving facility and state will be determined by Point Ruston following the award of the contract for Remedial Action construction. Point Ruston shall

provide the information required by Paragraph 34.a as soon as practicable after the award of the contract and before the Waste Material is actually shipped.

VII. REMEDY REVIEW

35. Periodic Review. Point Ruston shall conduct any studies and investigations as requested by EPA, in order to permit EPA to conduct reviews of whether the Remedial Action is protective of human health and the environment at least every five (5) years as required by Section 121(c) of CERCLA, 42 U.S.C. § 9621(c), and any applicable regulations.

36. EPA Selection of Further Response Actions. If EPA determines, at any time, that the Remedial Action is not protective of human health and the environment, EPA may select further response actions for the Site in accordance with the requirements of CERCLA and the NCP.

37. Opportunity to Comment. Point Ruston and, if required by Sections 113(k)(2) or 117 of CERCLA, the public, will be provided with an opportunity to comment on any further response actions proposed by EPA as a result of the review conducted pursuant to Section 121(c) of CERCLA and to submit written comments for the record during the comment period.

38. Point Ruston's Obligation to Perform Further Response Actions. If EPA selects further response actions for the Site, Point Ruston shall undertake such further response actions to the extent necessary to meet Performance Standards. Point Ruston may invoke the procedures set forth in Section XIX (Dispute Resolution) of the Consent Decree to dispute (1) EPA's determination that further response action is necessary to meet Performance Standards, or (2) EPA's selection of the further response actions. Such disputes shall be resolved pursuant to Paragraph 83 of the Consent Decree.

39. Submissions of Plans. If Point Ruston is required to perform further response actions pursuant to Paragraph 38 it shall submit a plan for such work to EPA for approval in accordance with the procedures set forth in Section VI (Performance of the Work by Point Ruston) and shall implement the plan approved by EPA in accordance with the provisions of this Consent Decree.

VIII. QUALITY ASSURANCE, SAMPLING, AND DATA ANALYSIS

40. Point Ruston shall use quality assurance, quality control, and chain of custody procedures for all samples in accordance with "EPA Requirements for Quality Assurance Project Plans for Environmental Data Operation," (EPA QA/R5); "Preparing Perfect Project Plans," (EPA/600/9-88/087), and subsequent amendments to such guidelines upon notification by EPA to Point Ruston of such amendment. Amended guidelines shall apply only to procedures conducted after such notification. A Site Quality Assurance Plan ("QAPP") was prepared by Asarco and approved by EPA. The QAPP prepared by Asarco may be used except where activities not covered under the existing QAPP are performed. If relevant to the proceeding, the Parties agree that validated sampling data generated in accordance with the QAPP(s) and reviewed and approved by EPA shall be admissible as evidence, without objection, in any proceeding under this Consent Decree. Point Ruston shall ensure that EPA and State personnel and their authorized representatives are allowed access at reasonable times to all laboratories utilized by Point Ruston in implementing this Consent Decree. In addition, Point Ruston shall ensure that such laboratories shall analyze all samples submitted by EPA pursuant to the QAPP for quality assurance monitoring. Point Ruston shall ensure that the laboratories it utilizes for the wet chemistry analyses of samples taken pursuant to this Consent Decree perform all analyses according to accepted EPA methods. Accepted EPA methods consist of those methods which are documented in the "Contract Lab Program Statement of Work for Inorganic Analysis" and the "Contract Lab Program Statement of Work for Organic Analysis," dated February 1988, and any amendments made thereto during the course of the implementation of this Decree. Point Ruston shall ensure that all laboratories it uses for analysis of samples taken pursuant to this Consent Decree participate in an EPA or EPA-equivalent QA/QC program. Point Ruston shall ensure that all field methodologies utilized in collecting samples for subsequent analysis pursuant to this Consent Decree will be conducted in accordance with the procedures set forth in the QAPP approved by EPA.

41. Upon request, Point Ruston shall allow split or duplicate samples to be taken by EPA and the State or their authorized representatives. Point Ruston shall notify EPA not less than fourteen (14) days in advance of any sample collection activity unless shorter notice is agreed to by EPA. In addition, EPA and the State shall have the right to take any additional samples that EPA or the State deem necessary. Upon request, EPA and the State shall allow Point Ruston to take split or duplicate samples of any samples it takes as part of the Plaintiff's oversight of Point Ruston's implementation of the Work.

42. Point Ruston shall submit to EPA four (4) copies and to the State two (2) copies of the results of all sampling and/or tests or other data obtained or generated by or on behalf of Point Ruston with respect to the Site and/or the implementation of this Consent Decree unless EPA agrees otherwise.

43. Notwithstanding any provision of this Consent Decree, the United States hereby retains all of its information gathering and inspection authorities and rights, including enforcement actions related thereto, under CERCLA, RCRA, and any other applicable statutes or regulations.

IX. ACCESS AND INSTITUTIONAL CONTROLS

44. Point Ruston agrees to provide the United States, the State, and their representatives, including EPA and its contractors, access at all reasonable times to the Site and any other property to which access is required for the implementation of this Consent Decree, to the extent access to the property is controlled by Point Ruston, for the purposes of conducting any activity related to this Consent Decree including, but not limited to:

- a. Monitoring the Work;
- b. Verifying any data or information submitted to the United States;
- c. Conducting investigations relating to contamination at or near the Site;
- d. Obtaining samples;
- e. Assessing the need for, planning, or implementing additional response actions at or near the Site;

f. Inspecting and copying records, operating logs, contracts, or other documents maintained or generated by Point Ruston or its agents, consistent with Section XXIV; and

g. Assessing Point Ruston's compliance with this Consent Decree.

45. To the extent that properties within the Site or any other property to which access is required for the implementation of this Consent Decree is owned or controlled by persons other than Point Ruston, Point Ruston shall use best efforts to secure from such persons access for Point Ruston, as well as for the United States and the State and their representatives, including, but not limited to, their contractors, as necessary to effectuate this Consent Decree. For purposes of this Paragraph, "best efforts" includes the payment of reasonable sums of money in consideration of access. If any access required to complete the Work is not obtained within forty-five (45) days of the date of entry of this Consent Decree, or within forty-five (45) days of the date EPA notifies Point Ruston in writing that additional access beyond that previously secured is necessary, Point Ruston shall promptly notify the United States in writing, and shall include in that notification a summary of the steps Point Ruston has taken to attempt to obtain access. The United States may, as it deems appropriate, assist Point Ruston in obtaining access. Point Ruston shall reimburse the United States, in accordance with the procedures in Section XVI (Reimbursement of Response Costs), for all costs incurred by the United States in obtaining access.

46. Notwithstanding any provision of this Consent Decree, the United States retains all of its access authorities and rights, including enforcement authorities related thereto, under CERCLA, RCRA and any other applicable statute or regulations.

47. Institutional Controls.

a. Point Ruston agrees that it is appropriate and necessary to impose land and groundwater use restrictions on the property that it owns within the Site as covenants that will run with the land for the purpose of protecting human health and the environment by protecting

in perpetuity the remedial actions that have been, and will be taken at the Site, and has implemented such covenants by recording the CC&Rs.

b. The following restrictions apply to all real property owned by Point Ruston within the Site and are binding on Point Ruston and its lessees, transferees, successors and assigns who assume any interest in such property:

(1) Unless approved by EPA, at no time shall groundwater underlying the Site be extracted, except for the limited purpose of extracting and treating groundwater or monitoring groundwater levels. Groundwater wells installed for such purpose shall only be installed pursuant to a plan approved in writing by the EPA Project Coordinator.

(2) Unless approved in writing by the EPA Project Coordinator, no use or activity shall be permitted on any portion of the Site which may disturb or adversely affect any of the remedial measures at the Site, which measures include, without limitation: systems to collect, contain, treat, divert and discharge groundwater or surface water, or systems to contain or create a protective barrier covering soils and the slag shoreline.

c. Point Ruston shall comply with the restrictions identified in Paragraph 47.b for so long as it has an interest in any real property within the Site. Each lease, deed, title, or other instrument conveying an interest in the property shall include the restrictions identified in Paragraph 47.b as covenants, conditions and restrictions. In such instrument, Point Ruston shall retain an interest in the property sufficient to assure that under State law Point Ruston may compel the subsequent owner of the property to comply with the covenants, conditions and restrictions. In addition, the conveyance document will provide that the United States, on behalf of Point Ruston is authorized, in its discretion, to enforce compliance with the covenants, conditions and restrictions.

d. Point Ruston shall give written notice to EPA of its intent to transfer any interest in the property at least thirty (30) days prior to the anticipated transfer date. The notice shall include the proposed conveyance documents. EPA reserves the right to approve the

conveyance language as it relates to the covenants, conditions and restrictions to ensure that the language is consistent with this Consent Decree.

X. REPORTING REQUIREMENTS

48. In addition to any other requirement of this Consent Decree, Point Ruston shall submit four (4) copies to EPA and two (2) copies to the State of written monthly progress reports that: (a) describe the actions which have been taken toward achieving compliance with this Consent Decree during the previous month; (b) include a summary of all results of sampling and tests and all other data received or generated by Point Ruston or its contractors or agents in the previous month; (c) identify all work plans, plans and other deliverables required by this Consent Decree completed and submitted during the previous month; (d) describe all actions, including, but not limited to, data collection and implementation of work plans, which are scheduled for the next six weeks and provide other information relating to the progress of construction, including, but not limited to, as relevant, critical path diagrams, Gantt charts and Pert charts; (e) include information regarding percentage of completion, unresolved delays encountered or anticipated that may affect the future schedule for implementation of the Work, and a description of efforts made to mitigate those delays or anticipated delays; (f) include any modifications to the work plans or other schedules that Point Ruston has proposed to EPA or that has been approved by EPA; and (g) describe all activities undertaken in support of the Community Relations Plan during the previous month and those to be undertaken in the next four weeks. Point Ruston shall submit these progress reports to EPA and the State by the fifteenth day of every month following the effective date of the Second Amendment until EPA issues a Final Certification of Completion of Remedial Action as described in Paragraph 65 of the Consent Decree.

49. Point Ruston shall notify EPA of any change in the schedule described in the monthly progress report for the performance of any activity, including, but not limited to, data collection and implementation of work plans, no later than seven (7) days prior to the performance of the activity.

50. Upon the occurrence of any event during performance of the Work that Point Ruston is required to report pursuant to Section 103 of CERCLA or Section 304 of the Emergency Planning and Community Right-to-know Act (EPCRA), Point Ruston shall within twenty-four (24) hours of the onset of such event orally notify the EPA Project Coordinator or the Alternate EPA Project Coordinator (in the event of the unavailability of the EPA Project Coordinator), or, in the event that neither the EPA Project Coordinator nor Alternate EPA Project Coordinator is available, the Emergency Response Team, Region 10, United States Environmental Protection Agency. These reporting requirements are in addition to the reporting required by CERCLA Section 103 or EPCRA Section 304.

51. Within twenty (20) days of the onset of such an event, Point Ruston shall furnish to Plaintiff a written report, signed by Point Ruston's Project Coordinator, setting forth the events which occurred and the measures taken, and to be taken, in response thereto. Within thirty (30) days of the conclusion of such an event, Point Ruston shall submit a report setting forth all actions taken in response thereto.

52. Point Ruston shall submit four (4) copies of all plans, reports, and data required by the SOW, Work Plans, Construction Management Plans, or any other approved plans to EPA in accordance with the schedules set forth in such plans. Point Ruston shall simultaneously submit two (2) copies of all such plans, reports and data to the State.

53. All reports and other documents submitted by Point Ruston to EPA (other than the monthly progress reports referred to above) which purport to document Point Ruston's compliance with the terms of this Consent Decree shall be signed by an authorized representative of Point Ruston or its Project Coordinator.

XI. EPA APPROVAL OF PLANS AND OTHER SUBMISSIONS

54. After review of any plan, report or other item which is required to be submitted for approval pursuant to this Consent Decree, EPA, after reasonable opportunity for review and comment by the State, shall: (a) approve, in whole or in part, the submission; (b) approve the submission upon specified conditions; (c) modify the submission to cure the deficiencies;

(d) disapprove, in whole or in part, the submission, directing that Point Ruston modify the submission; or (e) any combination of the above. However, EPA shall not modify a submission without first providing Point Ruston at least one notice of deficiency and an opportunity to cure within ten (10) days, except where to do so would cause serious disruption to the Work or where previous submission(s) have been disapproved due to material defects and the deficiencies in the submission under consideration indicate a bad faith lack of effort to submit an acceptable deliverable.

55. In the event of approval, approval upon conditions, or modification by EPA, pursuant to Paragraph 54.a, b, or c, Point Ruston shall proceed to take any action required by the plan, report, or other item, as approved or modified by EPA subject only to its right to invoke the Dispute Resolution procedures set forth in Section XIX (Dispute Resolution) with respect to the modifications or conditions made by EPA. In the event that EPA modifies the submission to cure the deficiencies pursuant to Paragraph 54.c and the submission has a material defect, EPA retains its right to seek stipulated penalties, as provided in Section XX (Stipulated Penalties).

56. a. Upon receipt of a notice of disapproval pursuant to Paragraph 54.d, Point Ruston shall, within fourteen (14) days or such longer time as specified by EPA in such notice, correct the deficiencies and resubmit the plan, report, or other item for approval. Any stipulated penalties applicable to the submission, as provided in Section XX (Stipulated Penalties), shall accrue during the fourteen (14) day period or otherwise specified period but shall not be payable unless the resubmission is disapproved or modified due to a material defect as provided in Paragraphs 57 and 58.

b. Notwithstanding the receipt of a notice of disapproval pursuant to Paragraph 54.d, Point Ruston shall proceed, at the direction of EPA, to take any action required by any non-deficient portion of the submission. Implementation of any non-deficient portion of a submission shall not relieve Point Ruston of any liability for stipulated penalties under Section XX (Stipulated Penalties) as to any deficient portion.

57. In the event that a resubmitted plan, report or other item, or portion thereof, is disapproved by EPA, EPA may again require Point Ruston to correct the deficiencies, in accordance with the preceding Paragraphs. EPA also retains the right to modify or develop the plan, report or other item. Point Ruston shall implement any such plan, report, or item as modified or developed by EPA, subject only to its right to invoke the procedures set forth in Section XIX (Dispute Resolution).

58. If upon resubmission, a plan, report, or item is disapproved or modified by EPA due to a material defect, Point Ruston shall be deemed to have failed to submit such plan, report, or item timely and adequately unless Point Ruston invokes the dispute resolution procedures set forth in Section XIX (Dispute Resolution) and EPA's action is overturned pursuant to that Section. The provisions of Section XIX (Dispute Resolution) and Section XX (Stipulated Penalties) shall govern the implementation of the Work and accrual and payment of any stipulated penalties during Dispute Resolution. If EPA's disapproval or modification is upheld, stipulated penalties shall accrue for such violation from the date on which the initial submission was originally required, as provided in Section XX (Stipulated Penalties).

59. All plans, reports, and other items required to be submitted to EPA under this Consent Decree shall, upon approval or modification by EPA, be enforceable under this Consent Decree. In the event EPA approves or modifies a portion of a plan, report, or other item required to be submitted to EPA under this Consent Decree, the approved or modified portion shall be enforceable under this Consent Decree.

XII. PROJECT COORDINATORS

60. Unless already identified in Paragraph 118 below, within twenty (20) days of lodging of this Consent Decree, Point Ruston, EPA, and the State, will notify each other, in writing, of the name, address and telephone number of their respective designated Project Coordinators and Alternate Project Coordinators. If a Project Coordinator or Alternate Project Coordinator initially designated is changed, the identity of the successor will be given to the other parties at least five (5) working days before the changes occur, unless impracticable, but in

no event later than the actual day the change is made. Point Ruston's Project Coordinator shall be subject to disapproval by EPA, which disapproval shall not be unreasonably invoked, and shall have the technical expertise sufficient to adequately oversee all aspects of the Work. Unless agreed to in writing by EPA, Point Ruston's Project Coordinator shall not be an attorney for Point Ruston in this matter. Point Ruston's Project Coordinator may assign other representatives, including other contractors, to serve as a Site representative for oversight of performance of daily operations during remedial activities.

61. Plaintiff may designate other representatives, including, but not limited to, EPA and State employees, and federal and State contractors and consultants, to observe and monitor the progress of any activity undertaken pursuant to this Consent Decree. EPA's Project Coordinator and Alternate Project Coordinator shall have the authority lawfully vested in a Remedial Project Manager (RPM) and an On-Scene Coordinator (OSC) by the NCP, 40 C.F.R. Part 300. In addition, EPA's Project Coordinator or Alternate Project Coordinator shall have authority, consistent with the NCP, to halt any Work required by this Consent Decree and to take any necessary response action when he or she determines that conditions at the Site constitute an emergency situation or may present an immediate threat to public health or welfare or the environment due to release or threatened release of Waste Material.

XIII. ASSURANCE OF ABILITY TO COMPLETE WORK

62. Assurance of Ability to Complete Work.

a. Attached hereto in Appendix G are personal guarantees from, MC Construction, Michael A. Cohen, Kenneth J. and Kathryn Thomsen, and their marital communities, assuring that all Work required under this Consent Decree will be completed. However, when EPA issues the Final Certification of Completion for the entire Remedial Action as provided in Paragraph 65 of the Consent Decree, Point Ruston may seek to substitute other financial assurance mechanisms of the type set forth in subparagraph (c) to cover the remaining Work under the Decree.

b. Contemporaneous with the closing for the acquisition of the Purchased Property, Point Ruston executed the necessary documentation to ensure that the United States has a first priority lien or mortgage on the Purchased Property (the "Lien"). However, the physical area referred to as Stack Hill is not part of the Purchased Property subject to the Lien. The Lien reflects the United States' potential claim under this Consent Decree and reflects that such liability was fairly estimated, prior to the entry of the Second Amendment, at \$28 million. Following Point Ruston's completion of a significant amount of Work at the Site, Point Ruston presently estimates the remaining liability to be approximately \$5.1 million.

c. Upon request for removal of the Lien from a discrete physical portion of the Purchased Property associated with any Phase of the Remedial Action Point Ruston wishes to proceed with, Point Ruston shall submit to EPA a written estimate of the costs that may be incurred in performing the Remedial Action within the applicable Phase. This estimate must also include the potential costs EPA might incur should it be required to take over completion of the work on that Phase should the work be left not completed. EPA shall review those estimates and make its determination as to the necessary level of financial security for that Phase. Point Ruston shall establish financial security in the amount of the approved cost estimate for that Phase, and shall deposit the financial security documents into Escrow with Chicago Title Company or any other mutually agreed-to Escrow agent. Within fifteen (15) days after the financial security documents are deposited into Escrow, EPA shall remove the Lien on all parcels to be remediated in that Phase. Immediately after receiving notice from EPA that the Lien has been removed, the Escrow Holder shall release the financial security documents to EPA. The commencement of any Work Takeover pursuant to Paragraph 102 of the Consent Decree shall trigger EPA's right to receive the benefit of any financial security mechanisms provided in this Paragraph and at such time EPA shall have immediate access to resources guaranteed under any such mechanism whether in cash or in kind. EPA may use the funds from the financial security for any Phase: to complete the Remedial Action at that Phase; to apply to any costs owed by Point Ruston under this Consent Decree; or to perform any Work at the Site

required under the Consent Decree. Financial security shall be established, at Point Ruston's election, in one or more of the following forms:

1. A surety bond unconditionally guaranteeing payment and/or performance of Remedial Action in the applicable Phase;
2. One or more irrevocable letters of credit, payable to or at the direction of EPA, in the amount of the approved cost estimate for the applicable Phase;
3. A trust fund established for the benefit of EPA in the amount of the approved cost estimate for the applicable Phase;
4. A policy of insurance in the amount of the approved cost estimate for the applicable Phase that provides EPA with acceptable rights as a beneficiary; or
5. A demonstration by Point Ruston that it meets the financial test criteria of 40 C.F.R. § 264.143(f) with respect to the approved cost estimate for the applicable Phase, provided that all other requirements of 40 C.F.R. § 264.143(f) are satisfied.

Point Ruston shall maintain the financial security until EPA provides Certification of Completion with respect to the applicable Phase of Remedial Action, as provided in Paragraph 65 of the Consent Decree. Point Ruston and EPA shall follow this process for each Phase of Remedial Action for which Point Ruston requests a partial removal of the Lien.

63. In the event that EPA issues a Certification of Completion for any specific parcel of property, Point Ruston may request that EPA's lien be released as to that parcel and EPA shall release that lien so long as Point Ruston is current as to all payment obligations under Section XVI (Reimbursement of Response Costs) and XX (Stipulated Penalties).

64. Point Ruston may change the form of financial assurance provided under this Section at any time, upon notice to and approval by EPA, provided that the new form of assurance meets the requirements of this Section. In the event of a dispute, Point Ruston may change the form of the financial assurance only in accordance with the final administrative or judicial decision resolving the dispute.

XIV. CERTIFICATION OF COMPLETION

65. Certification of Completion.

(1) Certification of Phases

a. Within ninety (90) days after Point Ruston concludes that one or more Phases of Remedial Action has been fully performed, Point Ruston shall schedule and conduct a pre-certification inspection to be attended by Point Ruston, EPA and the State. If, after the pre-certification inspection, Point Ruston still believes that one or more Phases of Remedial Action has been fully performed, it shall within thirty (30) days of the inspection submit to EPA for approval, with a copy to the State, a written report as described in Section 3.2.1 of the SOW, requesting Certification of Completion with respect to that Phase or Phases. In the report, a registered professional engineer and Point Ruston's Project Coordinator shall state that the Phase (or Phases) of Remedial Action has been completed in accordance with the requirements of this Consent Decree. The written report shall include as-built drawings signed and stamped by a professional engineer. The report shall contain the following statement, signed by a responsible corporate official of Point Ruston or Point Ruston's Project Coordinator:

To the best of my knowledge, after thorough investigation, I certify that the information contained in or accompanying this submittal is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

b. If, after completion of the pre-certification inspection, receipt and review of the written report, and reasonable opportunity to review and comment by the State, EPA determines that the Phase (or Phases) of Remedial Action has not been completed in accordance with this Consent Decree, EPA will notify Point Ruston in writing of the activities that must be undertaken to complete the Phase (or Phases) of Remedial Action in accordance with this Consent Decree. EPA will set forth in the notice a schedule for performance of such activities consistent with the Consent Decree, or require Point Ruston to submit a schedule to EPA for approval pursuant to Section XI (EPA Approval of Plans and Other Submissions) of the Consent Decree. Point Ruston shall perform all activities described in the notice in accordance with the specifications and schedules established pursuant to this Paragraph, subject to its right to

invoke the dispute resolution procedures set forth in Section XIX (Dispute Resolution) of the Consent Decree.

c. If EPA concludes, based on the initial or any subsequent report requesting Certification of Completion and after a reasonable opportunity for review and comment by the State, that one or more Phases of Remedial Action have been performed in accordance with this Consent Decree, EPA will in a timely manner so certify in writing to Point Ruston.

(2) Final Certification of Completion

a. In order to ensure that completion of all Phases results in completion of the Remedial Action and satisfaction of the Performance Standards, within ninety (90) days after Point Ruston concludes that all Remedial Action has been performed and all the Performance Standards have been attained, Point Ruston shall schedule and conduct a pre-certification inspection to be attended by Point Ruston, EPA and the State. If, after the pre-certification inspection, Point Ruston still believes that all Remedial Action has been fully performed, it shall within thirty (30) days of the inspection submit to EPA for approval, with a copy to the State, a written report as described in Section 3.2.2 of the SOW, requesting Certification of Completion. In the report, a registered professional engineer and Point Ruston's Project Coordinator shall state that the Remedial Action has been completed in full satisfaction of the requirements of this Consent Decree. The written report shall include as-built drawings signed and stamped by a professional engineer. The report shall contain the following statement, signed by a responsible corporate official of Point Ruston or Point Ruston's Project Coordinator:

To the best of my knowledge, after thorough investigation, I certify that the information contained in or accompanying this submittal is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

b. If, after completion of the pre-certification inspection, receipt and review of the written report, and reasonable opportunity to review and comment by the State, EPA determines that the Remedial Action has not been completed in accordance with this

Consent Decree, EPA will notify Point Ruston in writing of the activities that must be undertaken to complete the Remedial Action in accordance with this Consent Decree. EPA will set forth in the notice a schedule for performance of such activities consistent with the Consent Decree, or require Point Ruston to submit a schedule to EPA for approval pursuant to Section XI (EPA Approval of Plans and Other Submissions) of the Consent Decree. Point Ruston shall perform all activities described in the notice in accordance with the specifications and schedules established pursuant to this Paragraph, subject to its right to invoke the dispute resolution procedures set forth in Section XIX (Dispute Resolution) of the Consent Decree.

c. If EPA concludes, based on the initial or any subsequent report requesting Certification of Completion and after a reasonable opportunity for review and comment by the State, that the Remedial Action has been performed in full satisfaction of this Consent Decree, EPA will promptly so certify in writing to Point Ruston. This certification shall constitute the Certification of Completion of the Remedial Action for purposes of the Consent Decree, including, but not limited to, Section XXI (Covenants Not to Sue by Plaintiff). Certification of Completion of the Remedial Action shall not affect Point Ruston's obligations under the Consent Decree.

66. Completion of the Work

a. Within ninety (90) days after Point Ruston concludes that all phases of the Work (including O & M) have been fully performed, Point Ruston shall schedule and conduct a pre-certification inspection to be attended by Point Ruston, EPA and the State. If, after the pre-certification inspection, Point Ruston still believes that the Work has been fully performed, Point Ruston shall submit a written report by a registered professional engineer that the Work has been completed in full satisfaction of the requirements of this Consent Decree. The report shall contain the following statement, signed by a responsible corporate official of Point Ruston or Point Ruston's Project Coordinator:

To the best of my knowledge, after thorough investigation, I certify that the information contained in or accompanying this submission is true, accurate and complete. I am aware

that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

If, after review of the written report, EPA, after reasonable opportunity to review and comment by the State, determines that any portion of the Work has not been completed in accordance with this Consent Decree, EPA will notify Point Ruston in writing of the activities that must be undertaken by Point Ruston pursuant to this Consent Decree to complete the Work. Provided, however, that EPA may only require Point Ruston to perform such activities pursuant to this Paragraph to the extent that such activities are consistent with the "scope of the remedy selected in the ROD," as that term is defined in Paragraph 32.b. EPA will set forth in the notice a schedule for performance of such activities consistent with the Consent Decree and the SOW or require Point Ruston to submit a schedule to EPA for approval pursuant to Section XI (EPA Approval of Plans and Other Submissions). Point Ruston shall perform all activities described in the notice in accordance with the specifications and schedules established therein, subject to its right to invoke the dispute resolution procedures set forth in Section XIX (Dispute Resolution).

b. If EPA concludes, based on the initial or any subsequent request for Certification of Completion by Point Ruston and after a reasonable opportunity for review and comment by the State, that the Work has been performed in accordance with this Consent Decree, EPA will so notify Point Ruston in writing.

XV. EMERGENCY RESPONSE

67. In the event of any action or occurrence during the performance of the Work which causes or threatens a release of Waste Material from the Site that constitutes an emergency situation or may present an immediate threat to public health or welfare or the environment, Point Ruston shall, subject to Paragraph 68, immediately take all appropriate action to prevent, abate, or minimize such release or threat of release, and shall immediately notify the EPA's Project Coordinator, or, if the Project Coordinator is unavailable, EPA's Alternate Project Coordinator. If neither of these persons is available, Point Ruston shall notify the EPA Emergency Response Team, Region 10. Point Ruston shall take such actions in consultation with EPA's Project Coordinator or other available authorized EPA officer and in accordance with

all applicable provisions of the Health and Safety Plans, the Contingency Plans, and any other applicable plans or documents developed pursuant to the SOW. In the event that Point Ruston fails to take appropriate response action as required by this Section, and EPA takes such action instead, Point Ruston shall reimburse EPA all costs of the response action not inconsistent with the NCP pursuant to Section XVI (Reimbursement of Response Costs).

68. Nothing in the preceding Paragraph or in this Consent Decree shall be deemed to limit any authority of the United States a) to take all appropriate action to protect human health and the environment or to prevent, abate, respond to, or minimize an actual or threatened release of Waste Material on, at, or from the Site, or b) to direct or order such action, or seek an order from the Court, to protect human health and the environment or to prevent, abate, respond to, or minimize an actual or threatened release of Waste Material on, at, or from the Site, subject to Section XXI (Covenants Not to Sue by Plaintiff).

XVI. REIMBURSEMENT OF RESPONSE COSTS

69. To resolve the United States' claims for Past Due Oversight Costs and Past Due DPA Claims, the United States and Point Ruston agree as follows. The total due under the Consent Decree will be established at \$4,426,413.09 as of April 17, 2016. Beginning April 17, 2016, Interest shall accrue on that amount at a rate of 5% per annum, compounded annually. To resolve this obligation, Point Ruston shall make the following payments no later than the following dates: \$865,616 due September 15, 2016; \$865,616 due March 15, 2017; \$865,616 due September 15, 2017; \$865,616 due March 15, 2018, and the balance due September 15, 2018. Point Ruston has the right to pre-pay these amounts, along with any Interest accrued at the time of payment.

70. Point Ruston shall reimburse the EPA Hazardous Substance Superfund for all Future Response Costs not inconsistent with the NCP. The United States will send Point Ruston a bill requiring payment that includes a Superfund Cost Organization Recovery Enhancement

System Report, which includes direct and indirect costs incurred by EPA and DOJ and their contractors on an annual basis. Point Ruston shall make all payments within thirty (30) days of Point Ruston's receipt of each bill requiring payment, except as otherwise provided in Paragraph 71. Point Ruston shall make all payments required by this Paragraph in the form of a certified or cashier's check or checks made payable to "EPA Hazardous Substance Superfund" and referencing EPA Region 10 and Site ID No. 10-58, and DOJ case number 90-11-2-698/2 and the name and address of the party making payment. Point Ruston shall forward the check(s) to:

U.S. Environmental Protection Agency
Cincinnati Finance Center Box 979076
St. Louis, MO 63197-9000

and shall send copies of the check(s) to the United States as specified in Section XXVI (Notices and Submissions) and, Regional Financial Management Officer, 1200 6th Avenue, Suite 900, OMP-213, Seattle, Washington 98101.

71. Point Ruston may contest payment of any Future Response Costs under Paragraph 70 if it determines that the United States has made an accounting error or if it alleges that a cost item that is included represents costs that are inconsistent with the NCP. Such objection shall be made in writing within thirty (30) days of receipt of the bill and must be sent to the United States pursuant to Section XXVI (Notices and Submissions). Any such objection shall specifically identify the contested Future Response Costs and the basis for objection. In the event of an objection, Point Ruston shall within the thirty (30) day period pay all uncontested Future Response Costs to the United States in the manner described in Paragraph 70. Simultaneously, Point Ruston shall establish an interest bearing escrow account in a federally-insured bank acceptable to EPA and remit to that escrow account funds equivalent to the amount of the contested Future Response Costs. Point Ruston shall send to the United States, as provided in Section XXVI (Notices and Submissions), a copy of the transmittal letter and check paying the uncontested Future Response Costs, and a copy of the correspondence that establishes and funds the escrow account, including, but not limited to, information containing the identity of the bank

and bank account under which the escrow account is established as well as a bank statement showing the initial balance of the escrow account. Simultaneously with establishment of the escrow account, Point Ruston shall initiate the Dispute Resolution procedures in Section XIX (Dispute Resolution). If the United States prevails in the dispute, within five (5) days of the resolution of the dispute, Point Ruston shall pay the sums due (with accrued interest) to the United States, in the manner described in Paragraph 70. If Point Ruston prevails concerning any aspect of the contested costs, Point Ruston shall pay that portion of the costs (plus associated accrued interest) for which they did not prevail to the United States, in the manner described in Paragraph 70; Point Ruston shall be disbursed any balance of the escrow account. The dispute resolution procedures set forth in this Paragraph in conjunction with the procedures set forth in Section XIX (Dispute Resolution) shall be the exclusive mechanisms for resolving disputes regarding Point Ruston's obligation to reimburse the United States for its Future Response Costs.

72. In the event that the payments required by Paragraph 70 are not made within thirty (30) days of Point Ruston's receipt of the bill, Point Ruston shall pay Interest on the unpaid balance. The Interest on Future Response Costs shall begin to accrue on the date of the bill. The Interest shall accrue through the date of Point Ruston's payment. Payments of Interest made under this Section shall be in addition to such other remedies or sanctions available to Plaintiff by virtue of Point Ruston's failure to make timely payments under this Section. Point Ruston shall make all payments required by this Paragraph in the manner described in Paragraph 70.

XVII. INDEMNIFICATION AND INSURANCE

73. a. The United States does not assume any liability by entering into this agreement or by virtue of any designation of Point Ruston as EPA's authorized representative under Section 104(e) of CERCLA. Point Ruston shall indemnify, save and hold harmless the United States and its officials, agents, employees, contractors, subcontractors, or representatives for or from any and all claims or causes of action arising from, or on account of, negligent or other wrongful acts or omissions of Point Ruston, its officers, directors, employees, agents, contractors, subcontractors, and any persons acting on their behalf or under their control, in

carrying out activities pursuant to this Consent Decree, including, but not limited to, any claims arising from any designation of Point Ruston as EPA's authorized representative under Section 104(e) of CERCLA. Further, Point Ruston agrees to pay the United States all costs it incurs including, but not limited to, attorneys fees and other expenses of litigation and settlement arising from, or on account of, claims made against the United States based on negligent or other wrongful acts or omissions of Point Ruston, its officers, directors, employees, agents, contractors, subcontractors, and any persons acting on their behalf or under their control, in carrying out activities pursuant to this Consent Decree. The United States shall not be held out as a party to any contract entered into by or on behalf of Point Ruston in carrying out activities pursuant to this Consent Decree. Neither Point Ruston nor any such contractor shall be considered an agent of the United States.

b. The United States shall give Point Ruston notice of any claim for which the United States plans to seek indemnification pursuant to Paragraph 73.a, and shall consult with Point Ruston prior to settling such claim.

74. Point Ruston waives all claims against the United States for damages or reimbursement or for set-off of any payments made or to be made to the United States, arising from or on account of any contract, agreement, or arrangement between any one or more of Point Ruston and any person for performance of Work on or relating to the Site, including, but not limited to, claims on account of construction delays. In addition, Point Ruston shall indemnify and hold harmless the United States with respect to any and all claims for damages or reimbursement arising from or on account of any contract, agreement, or arrangement between Point Ruston and any person for performance of Work on or relating to the Site, including, but not limited to, claims on account of construction delays.

75. No later than fifteen (15) days before commencing any on-site Work, Point Ruston shall secure, and shall maintain until the first anniversary of EPA's Final Certification of Completion of the Remedial Action pursuant to Paragraph 65 of the Consent Decree, comprehensive general liability insurance and automobile insurance. The comprehensive

general liability coverage shall have an annual aggregate limit of not less than two (2) million dollars. In addition, Point Ruston shall secure and shall maintain automobile liability insurance as follows: bodily injury liability -- five hundred thousand dollars (\$500,000) each person; one million dollars (\$1,000,000) each occurrence; property damage liability -- five hundred thousand dollars (\$500,000) each occurrence. In addition, for the duration of this Consent Decree, Point Ruston shall satisfy, or shall ensure that its contractors or subcontractors satisfy, all applicable laws and regulations regarding the provision of worker's compensation insurance for all persons performing the Work on behalf of Point Ruston in furtherance of this Consent Decree. Prior to commencement of the Work under this Consent Decree, Point Ruston shall provide to EPA certificates of such insurance and, upon written request, a copy of each insurance policy. Point Ruston shall resubmit such certificates and copies of any previously requested policies each year on the anniversary of the effective date of this Consent Decree. If Point Ruston demonstrates by evidence satisfactory to EPA that any contractor or subcontractor maintains insurance equivalent to that described above, or insurance covering the same risks but in a lesser amount, then, with respect to that contractor or subcontractor, Point Ruston need provide only that portion of the insurance described above which is not maintained by the contractor or subcontractor.

XVIII. FORCE MAJEURE

76. "Force Majeure," for purposes of this Consent Decree, is defined as any event arising from causes beyond the control of Point Ruston, of any entity controlled by Point Ruston, or of Point Ruston's contractors, that delays or prevents the performance of any obligation under this Consent Decree despite Point Ruston's best efforts to fulfill the obligation. The requirement that Point Ruston exercise "best efforts to fulfill the obligation" includes using best efforts to anticipate any potential force majeure event and best efforts to address the effects of any potential force majeure event (a) as it is occurring, and (b) following the potential force majeure event, such that the delay is minimized to the greatest extent possible. "Force Majeure" does not include financial inability to complete the Work or a failure to attain the Performance Standards.

77. If any event occurs or has occurred that may delay the performance of any obligation under this Consent Decree, whether or not caused by a force majeure event, Point Ruston shall notify orally EPA's Project Coordinator or, in his or her absence, EPA's Alternate Project Coordinator or, in the event both of EPA's designated representatives are unavailable, the Director of the Office of Environmental Cleanup, EPA Region 10, within forty-eight (48) hours of when Point Ruston first knew that the event might cause a delay. Within five (5) days thereafter, Point Ruston shall provide in writing to EPA an explanation and description of the reasons for the delay; the anticipated duration of the delay; all actions taken or to be taken to prevent or minimize the delay; a schedule for implementation of any measures to be taken to prevent or mitigate the delay or the effect of the delay; Point Ruston's rationale for attributing such delay to a force majeure event if it intends to assert such a claim; and a statement as to whether, in the opinion of Point Ruston, such event may cause or contribute to an endangerment to public health, welfare or the environment. Point Ruston shall include with any notice all available documentation supporting its claim that the delay was attributable to a force majeure event. Failure to comply with the above requirements shall preclude Point Ruston from asserting any claim of force majeure for that event for the period of time of such failure to comply, and for any additional delay caused by such failure. Point Ruston shall be deemed to know of any circumstance of which Point Ruston, any entity controlled by Point Ruston or Point Ruston's contractors knew or should have known.

78. If EPA agrees that the delay or anticipated delay is attributable to a force majeure event, the time for performance of the obligations under this Consent Decree that are affected by the force majeure event will be extended by EPA for such time as is necessary to complete those obligations. An extension of the time for performance of the obligations affected by the force majeure event shall not, of itself, extend the time for performance of any other obligation. If EPA does not agree that the delay or anticipated delay has been or will be caused by a force majeure event, EPA will notify Point Ruston in writing of its decision. If EPA agrees that the delay is attributable to a force majeure event, EPA will notify Point Ruston, in writing, of the

length of the extension, if any, for performance of the obligations affected by the force majeure event.

79. If Point Ruston elects to invoke the dispute resolution procedures set forth in Section XIX (Dispute Resolution), it shall do so no later than fifteen (15) days after receipt of EPA's notice. In any such proceeding, Point Ruston shall have the burden of demonstrating by a preponderance of the evidence that the delay or anticipated delay has been or will be caused by a force majeure event, that the duration of the delay or the extension sought was or will be warranted under the circumstances, that best efforts were exercised to avoid and mitigate the effects of the delay, and that Point Ruston complied with the requirements of Paragraphs 76 and 77, above. If Point Ruston carries this burden, the delay at issue shall be deemed not to be a violation by Point Ruston of the affected obligation of this Consent Decree identified to EPA and the Court.

XIX. DISPUTE RESOLUTION

80. Unless otherwise expressly provided for in this Consent Decree, the dispute resolution procedures of this Section shall be the exclusive mechanism to resolve disputes arising under or with respect to this Consent Decree. However, the procedures set forth in this Section shall not apply to actions by the United States to enforce obligations of Point Ruston that have not been disputed in accordance with this Section.

81. Any dispute which arises under or with respect to this Consent Decree shall in the first instance be the subject of informal negotiations between the parties to the dispute. The period for informal negotiations shall not exceed twenty (20) days from the time the dispute arises, unless it is modified by written agreement of the parties to the dispute. The dispute shall be considered to have arisen when one party sends the other parties a written Notice of Dispute.

82. a. In the event that the parties cannot resolve a dispute by informal negotiations under the preceding Paragraph, then the position advanced by EPA shall be considered binding unless, within ten (10) days after the conclusion of the informal negotiation period, Point Ruston invokes the formal dispute resolution procedures of this Section by serving

on the United States a written Statement of Position on the matter in dispute, including, but not limited to, any factual data, analysis or opinion supporting that position and any supporting documentation relied upon by Point Ruston. The Statement of Position shall specify Point Ruston's position as to whether formal dispute resolution should proceed under Paragraph 83 or 84.

b. Within fourteen (14) days after receipt of Point Ruston's Statement of Position, EPA will serve on Point Ruston its Statement of Position, including, but not limited to, any factual data, analysis, or opinion supporting that position and all supporting documentation relied upon by EPA. EPA's Statement of Position shall include a statement as to whether formal dispute resolution should proceed under Paragraph 83 or 84. Within ten (10) days after receipt of EPA's Statement of Position, Point Ruston may submit a reply.

c. If there is disagreement between EPA and Point Ruston as to whether dispute resolution should proceed under Paragraph 83 or 84, the parties to the dispute shall follow the procedures set forth in the Paragraph determined by EPA to be applicable. However, if Point Ruston ultimately appeals to the Court to resolve the dispute, the Court shall determine which Paragraph is applicable in accordance with the standards of applicability set forth in Paragraphs 83 and 84.

83. Formal dispute resolution for disputes pertaining to the selection or adequacy of any response action and all other disputes that are accorded review on the administrative record under applicable principles of administrative law shall be conducted pursuant to the procedures set forth in this Paragraph. For purposes of this Paragraph, the adequacy of any response action includes, without limitation: (i) the adequacy or appropriateness of plans, procedures to implement plans, or any other items requiring approval by EPA under this Consent Decree; and (ii) the adequacy of the performance of response actions taken pursuant to this Consent Decree. Nothing in this Consent Decree shall be construed to allow any dispute by Point Ruston regarding the validity of the ROD's provisions.

a. An administrative record of the dispute shall be maintained by EPA and shall contain all statements of position, including supporting documentation, submitted pursuant to this Section. Where appropriate, EPA may allow submission of supplemental statements of position by the parties to the dispute.

b. The Director of the Office of Environmental Cleanup, EPA Region 10, will issue a final administrative decision resolving the dispute based on the administrative record described in Paragraph 83.a. This decision shall be binding upon Point Ruston, subject only to the right to seek judicial review pursuant to Paragraph 83.c and d.

c. Any administrative decision made by EPA pursuant to Paragraph 83.b shall be reviewable by this Court, provided that a motion for judicial review of the decision is filed by Point Ruston with the Court and served on all Parties within ten (10) days of receipt of EPA's decision. The motion shall include a description of the matter in dispute, the efforts made by the parties to resolve it, the relief requested, and the schedule, if any, within which the dispute must be resolved to ensure orderly implementation of this Consent Decree. The United States may file a response to Point Ruston's motion.

d. In proceedings on any dispute governed by this Paragraph, Point Ruston shall have the burden of demonstrating that the decision of the Office of Environmental Cleanup Director is arbitrary and capricious or otherwise not in accordance with law. Judicial review of EPA's decision shall be on the administrative record compiled pursuant to Paragraph 83.a.

84. Formal dispute resolution for disputes that neither pertain to the selection or adequacy of any response action nor are otherwise accorded review on the administrative record under applicable principles of administrative law, shall be governed by this Paragraph.

a. Following receipt of Point Ruston's Statement of Position submitted pursuant to Paragraph 82, the Director of the Office of Environmental Cleanup, EPA Region 10, will issue a final decision resolving the dispute. The Office of Environmental Cleanup Director's decision shall be binding on Point Ruston unless, within ten (10) days of receipt of the decision, Point Ruston files with the Court and serves on the parties a motion for judicial review of the

decision setting forth the matter in dispute, the efforts made by the parties to resolve it, the relief requested, and the schedule, if any, within which the dispute must be resolved to ensure orderly implementation of the Consent Decree. The United States may file a response to Point Ruston's motion.

b. Notwithstanding Paragraph 15 of this Consent Decree, judicial review of any dispute governed by this Paragraph shall be governed by applicable principles of law.

85. The invocation of formal dispute resolution procedures under this Section shall not extend, postpone or affect in any way any obligation of Point Ruston under this Consent Decree not directly in dispute, unless EPA or the Court agrees otherwise. Stipulated penalties with respect to the disputed matter shall continue to accrue but payment shall be stayed pending resolution of the dispute as provided in Paragraph 94. Notwithstanding the stay of payment, stipulated penalties shall accrue from the first day of noncompliance with any applicable provision of this Consent Decree. In the event that Point Ruston does not prevail on the disputed issue, stipulated penalties shall be assessed and paid as provided in Section XX (Stipulated Penalties).

XX. STIPULATED PENALTIES

86. Point Ruston shall be liable for stipulated penalties in the amounts set forth in Paragraphs 87 and 88 to the United States for failure to comply with the requirements of this Consent Decree specified below, unless excused under Section XVIII (Force Majeure). "Compliance" by Point Ruston shall include completion of the activities under this Consent Decree or any work plan or other plan approved under this Consent Decree identified below in accordance with all applicable requirements of law, this Consent Decree, the SOW, and any plans or other documents approved by EPA pursuant to this Consent Decree and within the specified time schedules established by and approved under this Consent Decree.

87. a. The following stipulated penalties shall accrue per violation per day for any noncompliance identified in subparagraph b:

Penalty Per Violation

Period of Noncompliance

Per Day

\$250	1st -- 14th day
\$1,000	15th -- 30th day
\$2,500	31st day and beyond.

b. Activities/Deliverables

- (i) Conducting the Work without EPA approval.
- (ii) INTENTIONALLY OMITTED
- (iii) Failure to timely submit Construction Management Plans.
- (iv) Failure to timely submit corrected or revised Construction Management Plans in accordance with Section XI (EPA Approval of Plans and Other Submissions).
- (v) Failure to initiate remedial action activity in the specified time and/or in accordance with the plans required by this Consent Decree and the SOW.
- (vi) Failure to complete remedial action activities in the specified time and/or in accordance with the plans required by this Consent Decree and the SOW.

88. The following stipulated penalties shall accrue per violation per day for failure to submit timely or adequate reports or other written documents pursuant to Paragraphs 48 through 53, for failure to submit any other reports or written documents required by this Consent Decree or the SOW, or for the failure to perform any other requirement under this Consent Decree, except Section XIII (Assurance of Ability to Complete Work), and Paragraph 75 (Insurance).

<u>Penalty Per Violation Per Day</u>	<u>Period of Noncompliance</u>
\$200	1st -- 14th day
\$300	15th -- 30th day
\$750	31st day and beyond.

89. In the event that EPA assumes performance of a portion or all of the Work pursuant to Paragraph 102 of Section XXII (Covenants Not to Sue by Plaintiff), in addition to EPA's Response Costs, Point Ruston shall be liable for a stipulated penalty in the amount of three (3) times the cost incurred by EPA to perform the work or \$300,000, whichever is less.

90. All penalties shall begin to accrue on the day after the complete performance is due or the day a violation occurs, and shall continue to accrue through the final day of the correction of the noncompliance or completion of the activity. However, stipulated penalties shall not accrue: (1) with respect to a deficient submission under Section XI (EPA Approval of Plans and Other Submissions), during the period, if any, beginning on the 31st day after EPA's receipt of such submission until the date that EPA notifies Point Ruston of any deficiency; (2) with respect to a decision by the Director of the Office of Environmental Cleanup, EPA Region X, under Paragraph 83.b or 84.a of Section XIX (Dispute Resolution), during the period, if any, beginning on the 21st day after the date that Point Ruston's reply to EPA's Statement of Position is received until the date that the Director issues a final decision regarding such dispute; or (3) with respect to judicial review by this Court of any dispute under Section XIX (Dispute Resolution), during the period, if any, beginning on the 31st date after the Court's receipt of the final submission regarding the dispute until the date that the Court issues a final decision regarding such dispute. Nothing herein shall prevent the simultaneous accrual of separate penalties for separate violations of this Consent Decree.

91. Following EPA's determination that Point Ruston has failed to comply with a requirement of this Consent Decree, EPA may give Point Ruston written notification of the same and describe the noncompliance. EPA may send Point Ruston a written demand for the payment of the penalties. However, penalties shall accrue as provided in the preceding Paragraph regardless of whether EPA has notified Point Ruston of a violation.

92. All penalties accruing under this Section shall be due and payable to the United States within thirty (30) days of Point Ruston's receipt from EPA of a demand for payment of the penalties, unless Point Ruston invokes the Dispute Resolution procedures under Section XIX (Dispute Resolution). All payments to the United States under this Section shall be paid by certified or cashier's check made payable to "EPA Hazardous Substances Superfund," shall be mailed to:

U.S. Environmental Protection Agency
Cincinnati Finance Center Box 979076
St. Louis, MO 63197-9000

shall indicate that the payment is for stipulated penalties, shall reference EPA Region 10 and Site ID #10EZ, and the DOJ case number 90-11-2-698/2 and the name and address of the party making payment. Copies of check(s) paid pursuant to this Section, and any accompanying transmittal letter(s), shall be sent to the United States as provided in Section XXVI (Notices and Submissions) and to Scott Ryan, Regional Financial Management Officer, 1200 6th Avenue, Suite 900, MS OMP-213, Seattle, Washington 98102.

93. The payment of penalties shall not alter in any way Point Ruston's obligation to complete the performance of the Work required under this Consent Decree.

94. Penalties shall continue to accrue as provided in Paragraph 90 during any dispute resolution period, but need not be paid until the following:

a. If the dispute is resolved by agreement or by a decision of EPA that is not appealed to this Court, accrued penalties determined to be owing shall be paid to EPA within fifteen (15) days of the agreement or the receipt of EPA's decision or order;

b. If the dispute is appealed to this Court and the United States prevails in whole or in part, Point Ruston shall pay all accrued penalties determined by the Court to be owed to EPA within sixty (60) days of receipt of the Court's decision or order, except as provided in Subparagraph c below;

c. If the District Court's decision is appealed by any Party, Point Ruston shall pay all accrued penalties determined by the District Court to be owing to the United States into an interest-bearing escrow account within sixty (60) days of receipt of the Court's decision or order. Penalties shall be paid into this account as they continue to accrue, at least every sixty (60) days. Within fifteen (15) days of receipt of the final appellate court decision, the escrow agent shall pay the balance of the account to EPA or to Point Ruston to the extent that they prevail.

95. a. If Point Ruston fails to pay stipulated penalties when due, the United States may institute proceedings to collect the penalties, as well as interest. Point Ruston shall pay Interest on the unpaid balance, which shall begin to accrue on the date of demand made pursuant to Paragraph 92.

b. Nothing in this Consent Decree shall be construed as prohibiting, altering, or in any way limiting the ability of the United States to seek any other remedies or sanctions available by virtue of Point Ruston's violation of this Decree or of the statutes and regulations upon which it is based, including, but not limited to, penalties pursuant to Section 122(l) of CERCLA. Provided, however, that the United States shall not seek civil penalties pursuant to Section 122(1) of CERCLA for any violation for which a stipulated penalty is provided herein, except in the case of a willful violation of the Consent Decree.

96. Notwithstanding any other provision of this Section, the United States may, in its unreviewable discretion, waive any portion of stipulated penalties that have accrued pursuant to this Consent Decree.

XXI. COVENANTS NOT TO SUE BY PLAINTIFF

97. In consideration of the actions that will be performed and the payments that will be made by Point Ruston under the terms of the Consent Decree, and except as specifically provided in Paragraphs 98, 99, and 101 of this Section, the United States covenants not to sue or to take administrative action against Point Ruston pursuant to Sections 106 and 107(a) of CERCLA, 42 U.S.C. §§ 9606 and 9607(a), and Section 7003 of RCRA, 42 U.S.C. § 6973, relating to the Purchased Property, except for any part of the Purchased Property located within OU6. Except with respect to future liability, these covenants not to sue as they relate to the Purchased Property (except for any part of the Purchased Property located within OU6) shall take effect upon the effective date of the Second Amendment. With respect to future liability, these covenants not to sue shall take effect upon Certification of Completion of the Remedial Action by EPA pursuant to Paragraph 65 of Section XIV (Certification of Completion). These covenants not to sue are conditioned upon the satisfactory performance by Point Ruston of its

obligations under this Consent Decree. These covenants not to sue extend to Point Ruston's officers, directors, and employees to the extent that the alleged liability of the officer, director, or employee is based on its status and in its capacity as an officer, director, or employee of Point Ruston, and not to the extent that the alleged liability arose independently of any alleged liability of Point Ruston. The United States also grants a Covenant Not to Sue, which is not subject to the reservations in Paragraphs 98, 99, and 101, for all Stipulated Penalty claims that have accrued up through the date of lodging of this Third Amended Consent Decree. As to the portions of the Site that are not part of the Purchased Property, or for any part of the Purchased Property located within OU6, the following covenants not to sue apply:

Subject to the Reservation of Rights in this Consent Decree, as of the effective date of the Second Amendment, the United States covenants not to sue or take any other civil or administrative action against Point Ruston for any and all civil liability for injunctive relief or reimbursement of response costs pursuant to Sections 106 or 107 of CERCLA, 42 U.S.C. §§ 9606 or 9607 or Section 7003 of RCRA, 42 U.S.C. § 6973, with respect to the Existing Contamination at the Site. This covenant not to sue is conditioned on the satisfactory performance of Point Ruston's obligations under this Consent Decree. This covenant not to sue extends to Point Ruston, and also to Point Ruston's officers, directors, and employees to the extent that the alleged liability of the officer, director, or employee is based on its status and in its capacity as an officer, director, or employee of Point Ruston, and not to the extent that the alleged liability arose independently of any alleged liability of Point Ruston.

98. United States' Pre-certification reservations. Notwithstanding any other provision of this Consent Decree, the United States reserves, and this Consent Decree is without prejudice to, the right to institute proceedings in this action or in a new action, or to issue an administrative order seeking to compel Point Ruston (a) to perform further response actions relating to the Purchased Property (except for any part of the Purchased Property located within OU6) or (b) to reimburse the United States for additional costs of response if, prior to Certification of Completion of the Remedial Action:

(i) Conditions at the Site, previously unknown to EPA, are discovered, or
(ii) Information, previously unknown to EPA, is received, in whole or in part,
and these previously unknown conditions or information together with any other relevant information indicates that the Remedial Action is not protective of human health or the environment.

99. United States' Post-certification reservations. Notwithstanding any other provision of this Consent Decree, the United States reserves, and this Consent Decree is without prejudice to, the right to institute proceedings in this action or in a new action, or to issue an administrative order seeking to compel Point Ruston (a) to perform further response actions relating to the Purchased Property (except for any part of the Purchased Property located within OU6) or (b) to reimburse the United States for additional costs of response if, subsequent to Certification of Completion of the Remedial Action:

(i) Conditions at the Site, previously unknown to EPA, are discovered, or
(ii) Information previously unknown to EPA, is received, in whole or in part,
and these previously unknown conditions or this information together with other relevant information indicate that the Remedial Action is not protective of human health or the environment.

100. For purposes of Paragraph 98, the information and the conditions known to EPA shall include only that information and those conditions relating to the Purchased Property (except for any part of the Purchased Property located within OU6) known to EPA as of the date the ROD was signed and set forth in the Record of Decision for the Site and the administrative record supporting the Record of Decision. The information and conditions known to EPA shall also include any information received by EPA pursuant to the requirements of the Asarco Tacoma Smelter Consent Decree prior to May 1, 2006. For purposes of Paragraph 99, the information and the conditions known to EPA shall include that information and those conditions known to EPA as of the date of Certification of Completion of the Remedial Action and set forth in the Record of Decision, the administrative record supporting the Record of Decision, the post-

ROD administrative record or in any information received by EPA pursuant to the requirements of this Consent Decree prior to Certification of Completion of the Remedial Action. The information and conditions known to EPA shall also include the information and those conditions set forth in the OU6 ROD, the administrative record supporting the OU6 ROD, or any information received by EPA pursuant to the requirements of the Asarco Tacoma Smelter Consent Decree or this Consent Decree prior to Certification of Completion of the Remedial Action.

101. General reservations of rights. The covenants not to sue set forth above do not pertain to any matters other than those expressly specified in Paragraph 97. As to the Purchased Property (except for any part of the Purchased Property located within OU6), the United States reserves, and this Consent Decree is without prejudice to, all rights against Point Ruston, including but not limited to, the following:

(a) Claims based on a failure by Point Ruston to meet a requirement of this Consent Decree;

(b) Liability arising from the past, present, or future disposal, release, or threat of release of Waste Materials outside of the Site;

(c) Liability for future disposal of Waste Material at the Site, other than as provided in the ROD, the Work, or otherwise ordered by EPA;

(d) Liability for damages for injury to, destruction of, or loss of natural resources, and for the costs of any natural resource damage assessments;

(e) Criminal liability;

(f) Liability for violations of federal or state law which occur during or after implementation of the Remedial Action;

(g) Liability related to any activity associated with Paragraph 31.h, however, this reservation does not permit the United States to unilaterally amend the definition of Performance Standards and then seek to require Defendant to perform further work;

(h) INTENTIONALLY OMITTED

(i) Liability, prior to Certification of Completion of the Remedial Action, for additional response actions that EPA determines are necessary to achieve Performance Standards, but that cannot be required pursuant to Paragraph 32 (Modification of the SOW or Related Work Plans).

As to the portions of the Site that are not part of the Purchased Property or for any part of the Purchased Property located within OU6, the United States reserves, and this Consent Decree is without prejudice to, all rights against Point Ruston with respect to all other matters, including the following:

a. Claims based on a failure by Point Ruston to meet a requirement of this Consent Decree;

b. Liability arising from the past, present, or future disposal, release, or threat of release of Waste Materials outside of the Site;

c. any liability resulting from future releases of hazardous substances, pollutants or contaminants, at or from the Site caused or contributed to by Point Ruston, its successors, assignees, lessees or sublessees;

d. any liability resulting from the release or threat of release of hazardous substances, pollutants or contaminants, at the Site after the effective date of the Second Amendment, not within the definition of Existing Contamination;

e. criminal liability;

f. liability, if any, for damages for injury to, destruction of, or loss of natural resources, and for the costs of any natural resource damage assessment incurred by federal agencies other than EPA; and

g. any liability resulting from exacerbation by Point Ruston, its successors, assignees, lessees or sublessees, of Existing Contamination other than as provided in the ROD, the Work, or otherwise ordered by EPA; and

h. liability for violations of local, State or federal law or regulations. With respect to any claim or cause of action asserted by the United States, Point Ruston shall bear the

burden of proving that the claim or cause of action, or any part thereof, is attributable solely to Existing Contamination.

102. Work Takeover. In the event EPA determines that Point Ruston has ceased implementation of any portion of the Work, is seriously or repeatedly deficient or late in its performance of the Work, or is implementing the Work in a manner which may cause an endangerment to human health or the environment, EPA may assume the performance of all or any portions of the Work as EPA determines necessary. Point Ruston may invoke the procedures set forth in Section XIX (Dispute Resolution), Paragraph 83, to dispute EPA's determination that takeover of the Work is warranted under this Paragraph. Costs incurred by the United States in performing the Work pursuant to this Paragraph shall be considered Future Response Costs that Point Ruston shall pay pursuant to Section XVI (Reimbursement of Response Costs).

103. Notwithstanding any other provision of this Consent Decree, the United States retains all authority and reserves all rights to take any and all response actions authorized by law.

XXII. COVENANTS BY POINT RUSTON

104. Covenant Not to Sue. Subject to the reservations in Paragraph 105, Point Ruston hereby covenants not to sue and agrees not to assert any claims or causes of action against the United States with respect to the Site or this Consent Decree, including, but not limited to: (a) any direct or indirect claim for reimbursement from the Hazardous Substance Superfund (established pursuant to the Internal Revenue Code, 26 U.S.C. § 9507) through CERCLA Sections 106(b)(2), 107, 111, 112, 113, or any other provision of law; (b) any claims against the United States, including any department, agency, or instrumentality of the United States under CERCLA Sections 107 or 113 related to the Site, except as set forth in Paragraph 105.b.; or (c) any claims arising out of response activities at the Site, including claims based on EPA's selection of response actions, oversight of response activities or approval of plans for such activities.

105. a. Point Ruston reserves, and this Consent Decree is without prejudice to, claims against the United States subject to the provisions of Chapter 171 of Title 28 of the United States Code, for money damages for injury or loss of property or personal injury or death caused by the negligent or wrongful act or omission of any employee of the United States while acting within the scope of his office or employment under circumstances where the United States, if a private person, would be liable to the claimant in accordance with the law of the place where the act or omission occurred. However, any such claim shall not include a claim for any damages caused, in whole or in part, by the act or omission of any person, including any contractor, who is not a federal employee as that term is defined in 28 U.S.C. § 2671; nor shall any such claim include a claim based on EPA's selection of response actions, or the oversight or approval of Point Ruston's plans or activities. The foregoing applies only to claims which are brought pursuant to any statute other than CERCLA and for which the waiver of sovereign immunity is found in a statute other than CERCLA.

b. Except as provided in Paragraph 111 of the Consent Decree, Point Ruston's covenants not to sue shall not apply in the event that the United States brings a cause of action or issues an order pursuant to the reservations set forth in Paragraph 101 of the Consent Decree, but only to the extent that Point Ruston's claims arise from the same response action, response costs, or damages, that the United States is seeking pursuant to the applicable reservation.

106. Nothing in this Consent Decree shall be deemed to constitute preauthorization of a claim within the meaning of Section 111 of CERCLA, 42 U.S.C. § 9611, or 40 C.F.R. 300.700(d).

XXIII. EFFECT OF SETTLEMENT; CONTRIBUTION PROTECTION

107. Nothing in this Consent Decree shall be construed to create any rights in, or grant any cause of action to, any person not a Party to this Consent Decree. The preceding sentence shall not be construed to waive or nullify any rights that any person not a signatory to this decree may have under applicable law. Each of the Parties expressly reserves any and all rights

(including, but not limited to, any right to contribution), defenses, claims, demands, and causes of action which each Party may have with respect to any matter, transaction, or occurrence relating in any way to the Site against any person not a Party hereto.

108. The Parties agree, and by entering this Consent Decree this Court finds, that Point Ruston is entitled, as of the effective date of the Second Amendment, to protection from contribution actions or claims as provided by CERCLA Section 113(f)(2), 42 U.S.C. § 9613(f)(2) for matters addressed in this Consent Decree.

109. Point Ruston agrees that with respect to any suit or claim for contribution brought by it for matters related to this Consent Decree it will notify the United States in writing no later than sixty (60) days prior to the initiation of such suit or claim.

110. Point Ruston also agrees that with respect to any suit or claim for contribution brought against it for matters related to this Consent Decree it will notify in writing the United States within ten (10) days of service of the complaint on it. In addition, Point Ruston shall notify the United States within ten (10) days of service or receipt of any Motion for Summary Judgment and within ten (10) days of receipt of any order from a court setting a case for trial.

111. In any subsequent administrative or judicial proceeding initiated by the United States for injunctive relief, recovery of response costs, or other appropriate relief relating to the Site, Point Ruston shall not assert, and may not maintain, any defense or claim based upon the principles of waiver, res judicata, collateral estoppel, issue preclusion, claim-splitting, or other defenses based upon any contention that the claims raised by the United States in the subsequent proceeding were or should have been brought in the instant case; provided, however, that nothing in this Paragraph affects the enforceability of the covenants not to sue set forth in Section XXI (Covenants Not to Sue by Plaintiff).

XXIV. ACCESS TO INFORMATION

112. Point Ruston shall provide to EPA and the State, upon request, copies of all documents and information within its possession or control or that of its contractors or agents relating to activities at the Site or to the implementation of this Consent Decree, including, but

not limited to, sampling, analysis, chain of custody records, manifests, trucking logs, receipts, reports, sample traffic routing, correspondence, or other documents or information related to the Work. Point Ruston shall also make available to EPA and the State, for purposes of investigation, information gathering, or testimony, its employees, agents, or representatives with knowledge of relevant facts concerning the performance of the Work.

113. a. Point Ruston may assert business confidentiality claims covering part or all of the documents or information submitted to Plaintiff under this Consent Decree to the extent permitted by and in accordance with Section 104(e)(7) of CERCLA, 42 U.S.C. § 9604(e)(7), and 40 C.F.R. § 2.203(b). Documents or information determined to be confidential by EPA will be afforded the protection specified in 40 C.F.R. Part 2, Subpart B. If no claim of confidentiality accompanies documents or information when they are submitted to EPA and the State, or if EPA has notified Point Ruston that the documents or information are not confidential under the standards of Section 104(e)(7) of CERCLA, the public may be given access to such documents or information without further notice to Point Ruston.

b. Point Ruston may assert that certain documents, records and other information are privileged under the attorney-client privilege or any other privilege recognized by federal law. If Point Ruston asserts such a privilege in lieu of providing documents, it shall provide the Plaintiff with the following: (i) the title of the document, record, or information; (ii) the date of the document, record, or information; (iii) the name and title of the author of the document, record, or information; (iv) the name and title of each addressee and recipient; (v) a description of the contents of the document, record, or information; and (vi) the privilege asserted by Point Ruston. However, no documents, reports, or other information created or generated pursuant to the requirements of the Consent Decree shall be withheld on the grounds that they are privileged.

114. No claim of confidentiality shall be made with respect to any data, including, but not limited to, all sampling, analytical, monitoring, hydrogeologic, scientific, chemical, or

engineering data, or any other data or factual information evidencing conditions related to the Work or implementation of the Consent Decree contained in otherwise privileged documents.

XXV. RETENTION OF RECORDS

115. Until ten (10) years after Point Ruston receives the Certification of Completion for the final Phase of Remedial Action, Point Ruston shall preserve and retain all records and documents now in its possession or control or which come into its possession or control that relate in any manner to the performance of the Work or liability of any person for response actions conducted and to be conducted at the Site, regardless of any corporate retention policy to the contrary. Until ten (10) years after Point Ruston receives the Certification of Completion for the final Phase of Remedial Action, Point Ruston shall also instruct its contractors and agents to preserve all documents, records, and information of whatever kind, nature, or description relating to the performance of the Work.

116. At the conclusion of this document retention period, Point Ruston shall notify the United States at least ninety (90) days prior to the destruction of any such records or documents, and, upon request by the United States, Point Ruston shall deliver any such records or documents to EPA. Point Ruston may assert that certain documents, records, and other information are privileged under the attorney-client privilege or any other privilege recognized by federal law. If Point Ruston asserts such a privilege, it shall provide the Plaintiff with the following: (a) the title of the document, record, or information; (b) the date of the document, record, or information; (c) the name and title of the author of the document, record, or information; (d) the name and title of each addressee and recipient; (e) a description of the subject of the document, record, or information; and (f) the privilege asserted by Point Ruston. However, no documents, reports, or other information created or generated pursuant to the requirements of the Consent Decree shall be withheld on the grounds that they are privileged.

117. INTENTIONALLY OMITTED

XXVI. NOTICES AND SUBMISSIONS

118. Whenever, under the terms of this Consent Decree, written notice is required to be given or a report or other document is required to be sent by one Party to another, it shall be directed to the individuals at the addresses specified below, unless those individuals or their successors give notice of a change to the other Parties in writing. All notices and submissions shall be considered effective upon receipt, unless otherwise provided. Written notice as specified herein shall constitute complete satisfaction of any written notice requirement of the Consent Decree with respect to the United States, EPA, the State, and Point Ruston, respectively.

As to the United States:

Chief, Office of Environmental Enforcement Section
Environment and Natural Resources Division
U.S. Department of Justice
P.O. Box 7611
Washington, D.C. 20044-7611

XXVII. EFFECTIVE DATE

119. The effective date of this Consent Decree shall be the date upon which this Consent Decree is entered by the Court, except as otherwise provided herein.

XXVIII. RETENTION OF JURISDICTION

120. This Court retains jurisdiction over both the subject matter of this Consent Decree and Point Ruston for the duration of the performance of the terms and provisions of this Consent Decree for the purpose of enabling any of the Parties to apply to the Court at any time for such further order, direction, and relief as may be necessary or appropriate for the construction or modification of this Consent Decree, or to effectuate or enforce compliance with its terms, or to resolve disputes in accordance with Section XIX (Dispute Resolution) hereof.

XXIX. APPENDICES

121. The following appendices are attached to and incorporated into this Consent Decree:

"Appendix A" is the Record of Decision dated March 24, 1995.

"Appendix E" is the map referenced in Paragraph 21(dd).

"Appendix F" is the Statement of Work as defined in this Consent Decree.

"Appendix G" are the Personal Guarantees described in Paragraph 62 of this Consent Decree.

"Appendix H" is the map identifying the seven parcels and the MMZ which are defined as the Remaining Site Cap Areas.

XXX. COMMUNITY RELATIONS

122. Point Ruston shall cooperate with EPA and the State in providing information regarding the Work to the public. As requested by EPA or the State, Point Ruston shall participate in the preparation of such information for dissemination to the public and in public

meetings which may be held or sponsored by EPA or the State to explain activities at or relating to the Site.

XXXI. MODIFICATION

123. Schedules specified in this Consent Decree for completion of the Work may be modified by agreement of EPA and Point Ruston. All such modifications shall be made in writing.

124. Except as provided in Paragraph 32 ("Modification of the SOW, Related Work Plans or Related CMPs), no material modifications shall be made to the SOW without written notification to and written approval of the United States, Point Ruston, and the Court. Prior to providing its approval to any modification, the United States will provide the State with a reasonable opportunity to review and comment on the proposed modification. Modifications to the SOW that do not materially alter that document may be made by written agreement between EPA, after providing the State with a reasonable opportunity to review and comment on the proposed modification, and Point Ruston.

125. Nothing in this Decree shall be deemed to alter the Court's power to enforce, supervise, or approve modifications to this Consent Decree.

XXXII. LODGING AND OPPORTUNITY FOR PUBLIC COMMENT

126. This Consent Decree shall be lodged with the Court for a period of not less than thirty (30) days for public notice and comment in accordance with Section 122(d)(2) of 42 U.S.C. § 9622(d)(2), and 28 C.F.R. § 50.7. The United States reserves the right to withdraw or withhold its consent if the comments regarding the Consent Decree disclose facts or considerations which indicate that the Consent Decree is inappropriate, improper, or inadequate. Point Ruston consents to the entry of this Consent Decree without further notice.

127. If, for any reason, the Court should decline to approve this Consent Decree in the form presented, this agreement is voidable at the sole discretion of any Party and the terms of the agreement may not be used as evidence in any litigation between the Parties.

XXXIII. SIGNATORIES/SERVICE

128. Each undersigned representative of Point Ruston to this Consent Decree and the Assistant Attorney General for Environment and Natural Resources of the Department of Justice certifies that he or she is fully authorized to enter into the terms and conditions of this Consent Decree and to execute and legally bind such Party to this document.

129. Point Ruston hereby agrees not to oppose entry of this Consent Decree by this Court or to challenge any provision of this Consent Decree unless the United States has notified Point Ruston in writing that it no longer supports entry of the Consent Decree.

130. Point Ruston shall identify, on the attached signature page, the name, address, and telephone number of an agent who is authorized to accept service of process by mail on behalf of it with respect to all matters arising under or relating to this Consent Decree. Point Ruston hereby agrees to accept service in that manner and to waive the formal service requirements set forth in Rule 4 of the Federal Rules of Civil Procedure and any applicable local rules of this Court, including, but not limited to, service of a summons.

XXXIV. ADDITIONAL RIGHTS, BENEFITS, AND OBLIGATIONS OF POINT RUSTON

131. Legally Required Notices. Point Ruston shall provide all legally required notices with respect to the discovery or release of any hazardous substances at the Site.

132. Cooperation, Assistance, and Access. Point Ruston shall provide full cooperation, assistance, and access to persons that are authorized to conduct response actions or natural resource restoration at the Site (including the cooperation and access necessary for the installation, integrity, operation, and maintenance of any complete or partial response actions or natural resource restoration at the Site).

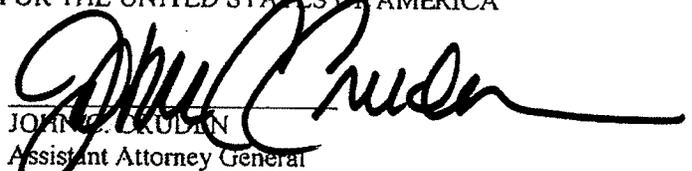

133. Assignment or Transfer. Notwithstanding any other provision of this Consent Decree, all of the obligations, rights, and benefits conferred upon Point Ruston under this Consent Decree may be assigned or transferred to any person with the written approval of the United States, Point Ruston, the Court, and the assignee or transferee.

SO ORDERED THIS _____ DAY OF _____, 2016.

UNITED STATES DISTRICT JUDGE

THE UNDERSIGNED PARTIES enter into this Consent Decree in the matter of United States v. Point Ruston, LLC, relating to the Asarco Tacoma Smelter Site, Operable Unit 02 and portions of Operable Unit 06 of the Commencement Bay Nearshore/Tideflats Superfund Site.

Site Name and Location

Commencement Bay Nearshore/Tideflats Superfund Site
Operable Unit 02 - Asarco Tacoma Smelter Facility and Slag Peninsula
Ruston and Tacoma, Washington

Statement of Basis and Purpose

This decision document presents the selected remedial action for the former Asarco Tacoma Smelter Facility and adjacent slag peninsula, in Ruston and Tacoma, Washington, which was chosen in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), as amended by the Superfund Amendments and Reauthorization Act (SARA), and to the extent practicable, the National Oil and Hazardous Substances Pollution Contingency Plan (NCP). This decision is based on the administrative record for this site. The State of Washington concurs with the selected remedy.

This Record of Decision (ROD) describes the final cleanup remedy for soil, slag and surface water and disposal of hazardous soils, demolition debris, and residential soils. This ROD is intended to be an interim action for ground water.

Assessment of the Site

Actual or threatened releases of hazardous substances from this site, if not addressed by implementing the response action selected in this ROD, may present an imminent or substantial endangerment to public health, welfare, or the environment.

Description of the Selected Remedy

EPA has divided the Commencement Bay/Nearshore Tideflats Superfund site into seven operable units (OUs) in order to facilitate the investigation, analysis, and cleanup of this very large site. Four of these OUs are associated with the former Asarco smelter:

- OU 02 Asarco Tacoma Smelter and Slag Peninsula
- OU 04 Asarco Off-Property (Ruston/North Tacoma Study Area)
- OU 06 Asarco Sediments
- OU 07 Asarco Demolition

The remedy described in this ROD addresses OU 02 and involves the cleanup of metal (e.g., arsenic, copper, lead) and organic contaminated soil, slag, and surface water and ground water found at the former smelter facility and adjacent slag peninsula. This remedy will address the principal threats posed by conditions at the Site, which are areas that continue to act as the primary known sources (source areas) of contamination to ground water and surface water that are flowing into Commencement Bay. The remedy includes the following elements:

- Excavate source area soils and slag (approximately 160,000 cubic yards).
- Dispose of source area soils and demolition debris designated as hazardous waste (approximately 240,000 cubic yards total) in an on-site containment facility (OCF) that meets or exceeds regulatory standards for hazardous waste landfills.
- Cap the entire Site (plant site soils and slag and the slag peninsula). The low permeability cap will be composed of layers of clean soils, gravel, and clay. The contaminated residential soils excavated from the Ruston/North Tacoma Study Area will be used as a sub-base for the cap.
- Demolish the remaining buildings and structures.
- Replace the entire surface water drainage system.
- Armor portions of the plant site and slag peninsula shoreline.
- Continue to monitor the surface water and ground water.

- Sample marine sediments.
- Develop and implement an enforceable program of restrictions and guidelines to supplement the actual cleanup activities to ensure that the remedial action remains protective and that development activities do not impact the long-term effectiveness of the cleanup.

If it is determined that source control activities do not result in ground water that meets federal and state standards, additional cleanup activities, if practicable, will be identified in a separate ROD.

Statutory Determinations

The selected remedy is protective of human health and the environment, complies with Federal and State requirements that are legally applicable or relevant and appropriate to the remedial action, and is cost-effective. This remedy utilizes permanent solutions and alternative treatment technologies to the maximum extent practicable for this Site. However, because treatment of the principal threats of the Site was found not to be practicable, this remedy does not satisfy the statutory preference for treatment as a principal element.

At this Site, EPA's determination that soil treatment was not practicable was based on several factors, including the effectiveness of an OCF at isolating contaminated soils and debris from the environment, the community's stated preference during public comment for on-site containment of contaminated waste, and the nearly \$30 million difference in cost between treatment and disposal of soil and disposal of soil without treatment in an OCF.

Because the remedy will result in hazardous substances remaining on-site above health-based levels, a review will be conducted no less often than every five years after commencement of remedial action to ensure that the remedy continues to provide adequate protection of human health and the environment.

Chuck Clarke
Regional Administrator
U.S. EPA Region 10

Date

**Commencement Bay Nearshore/Tideflats Superfund Site
Asarco Tacoma Smelter Site
Operable Unit 02
Tacoma/Ruston, Washington**

1.0 SITE DESCRIPTION

The Asarco Tacoma Smelter Superfund site ("Asarco Site" or "the Site") is an operable unit (OU) of the larger Commencement Bay Nearshore/Tideflats (CB N/T) Superfund site. The CB N/T Superfund site was listed on the interim priority list by the U.S. Environmental Protection Agency (EPA) in 1981, and included in the first published National Priorities List in September 1983. The Site is located on the western shore of Commencement Bay and consists of 67 acres of property owned by Asarco, Inc. and a 23 acre slag peninsula, home of the Tacoma Yacht Club. The Town of Ruston, the City of Tacoma and the Metropolitan Park District are the three municipalities that have zoning and permitting jurisdiction at this Site. This Record of Decision (ROD) addresses contaminated soils, slag, demolition debris, surface water and ground water on the Site.

The general area of the former Asarco Smelter consists of steep slopes extending down to Commencement Bay producing bluffs along portions of the shoreline. Many of the original smelter buildings and structures were constructed on slag fill, which extended the existing shoreline when molten slag from smelting operations was poured into Commencement Bay. A car tunnel and railroad tunnel are located between the stack hill and the arsenic kitchen area. Some dense vegetation exists on steep slopes (for example, the stack hill) and along the bluffs above Commencement Bay, see Figure 1-1.

The adjacent slag peninsula is composed of different forms of slag (molten or granulated) that were poured or placed on many occasions between 1930 and 1970. Its primary surface features are the Tacoma Yacht Club building, a paved access road, and paved parking areas. An estimated 15 million tons of slag exist at the smelter property and slag peninsula. Surface water features on the smelter property include surface water in the cooling pond and south and east stack hill areas and a number of springs and seeps around the stack hill and arsenic kitchen areas. Surface water drains into one of four drain systems and then into outfalls at the Site called the city (owned by the City of Tacoma), north, middle, and south outfalls. The latter three are owned by Asarco.

A complex pattern of ground water flows through or beneath the smelter property, including through the slag, into Commencement Bay. Three primary groundwater aquifers (water bearing zones) have been identified; two relatively shallow aquifers and one deep aquifer. A thick silt barrier exists between the shallow and deep aquifers throughout much of the Site. Because of the high degree of fractures in and porous nature of the slag, the tides bring seawater inland several hundred feet where it mixes with ground water. The ground water within each of the three aquifers is designated as either potential drinking water (Class IIB) or as non-potable water (Class III). No one is currently drinking the ground water at or near the Site.

Prior to 1890, a number of sawmills were active in the area and deposited wood waste along the shoreline. From 1890 through 1912, the property was used as a lead smelter and refinery. Asarco purchased the property in 1905 and converted it in 1912 into a facility to smelt and refine copper from copper bearing ores and concentrates shipped in from other locations. By-products of the smelting operations were further refined to produce other marketable products, such as arsenic, sulfuric acid, liquid sulfur dioxide, and slag. Asarco ended operation of the smelter in 1985.

Metals were released into the soil, air, and Commencement Bay as a result of the smelting and refining operations. Some examples of the metals present at the Site are arsenic, cadmium, copper, lead, and zinc. Metals in slag or released into soil have migrated to surface and ground water at the Site. Ores that were smelted at the Site have left metals in the buildings and structures on the Site.

There are no listed Resource Conservation and Recovery Act (RCRA) wastes at the Site. In several areas, contaminated soils are RCRA characteristic waste because they fail the Toxicity Characteristic leaching Procedure. Slag is not a RCRA waste under the Bevill exemption (40

There are no known floodplain zones or endangered species at this Site. There are several small areas of the Site, other than the cooling pond, that have been identified as potential wetlands. If these areas are confirmed as wetlands and if remediation occurs in these areas, the extent of mitigation will be determined during remedial design.

2.0 SITE HISTORY AND ENFORCEMENT ACTIVITIES

2.1 HISTORICAL SITE ACTIVITIES

During the active industrial life of the Asarco Tacoma Smelter, the primary product was refined copper. By-products of the copper smelting process included sulfuric acid, liquid sulfur dioxide, arsenic trioxide, arsenic metal, and copper reverberatory slag. The following is a brief chronological summary of operations at the former Asarco Tacoma smelter.

1890	Began operation as a lead smelter under ownership of the Tacoma Smelter Company.
1902	Copper production was started.
1905	Asarco purchased the smelter.
1917	Plant was rebuilt, stack was constructed, electrostatic precipitators were added.
1930	Blast furnace smelting operations were discontinued and replaced with reverberatories that produced slag as one by-product.
1974	A liquid sulfur dioxide plant began operation, using a dimethylaniline process.
1977	A baghouse was installed to handle dust from the arsenic kitchen and metallic arsenic plant.
1978	Electrolytic refinery ceased operation.
1985	Copper smelting operations were discontinued.
1986	Arsenic production was discontinued, and facility was taken completely out of production.

As described above, much of the present facility is built over fill material, including slag, which was placed by Asarco as part of the smelter operations. Since January 1987, Asarco has completed two phases of demolition activities at the Site. Facilities in the stack area associated with copper smelting and the production of both arsenic trioxide and metallic arsenic were demolished in 1987-1988 during Phase I Site Stabilization. The majority of the remaining building and structures, including the smelter stack, were demolished in 1992-1994 during Phase II Site Stabilization. Much of the Site (where these facilities were located) has been leveled and, to a minor extent, graded.

2.2 ENFORCEMENT ACTIVITIES

The history of regulatory activities affecting the former Asarco Tacoma Smelter began in the late 1960s with the passage of air emission standards by the Puget Sound Air Pollution Control Authority (PSAPCA). EPA requirements such as National Pollution Discharge Elimination Systems (NPDES) permits, which regulate point source water discharges, were applied in 1975.

Although PSAPCA began regulating sulfur dioxide and arsenic emissions in 1968, variances to the standards were granted to Asarco until 1975. EPA began enforcement proceedings in the early 1980s to regulate air emissions. Federal and state standards anti variances continued to be issues of contention until the smelter closed in 1985.

In July of 1983 EPA issued proposed standards for arsenic under Section 112 (National Emission Standards for Hazardous Air Pollutants) of the Clean Air Act. Inorganic arsenic had been designated as a hazardous air pollutant in 1980 and the Asarco smelter was a major source of arsenic. The proposed standard for Asarco, requiring hoods on the converters used in the smelting process, was modified after public comment to require, in addition to the hoods, better management practices in handling arsenic contaminated materials. These regulations were never implemented due to a decision by Asarco to cease copper refining in 1985.

In September 1986, Asarco signed an Administrative Order on Consent (AOC) with EPA pursuant to

Section 106(a) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), in which Asarco agreed to conduct a Remedial Investigation and Feasibility Study (RI/FS) and perform immediate site stabilization activities. Asarco's contractors began the RI/FS in 1987 under EPA oversight. Site stabilization, Phase I and II, were both conducted based on the information collected during the initial investigation of the Site.

In December 1990, EPA issued a ROD for demolition of structures and construction of a surface water diversion system. Asarco agreed to perform this work in a consent decree dated May 18, 1992.

The field investigation and evaluation of remedial alternatives for a final RI/FS was concluded by Asarco in January 1993 and was used to develop a final Site remedy.

In addition to the smelter property itself, Asarco is a responsible party for three closely related OU of the CB N/T Superfund Site, known as Ruston/North Tacoma Study Area, Asarco Sediments and Demolition. These units are reviewed below in the Section 4.0, "Scope and Role of Operable Units."

The following is a brief chronological summary of enforcement activities associated with the former Asarco Tacoma smelter.

1986	AOC for RI/FS and Phase I site stabilization signed.
1988	Phase I Site stabilization (demolition) activities completed.
1989	Draft RI/FS submitted.
1989	AOC for Expedited Response Action in Ruston/North Tacoma signed.
1990	Notice of Violation for RI/FS issued.
1990	Interim ROD for Phase II Site stabilization (demolition) and surface water controls issued.
1991	Additional investigation of soils and groundwater contamination commences.
1992	Notice of Violation resolved.
1992	Consent Decree for demolition entered in federal court.
1992	Fifth Amendment to the 1986 AOC revising the schedule for the draft and final RI/FS submittals signed. ¹
1993	Two stipulated Penalties for late draft FS submittals paid by Asarco.
1993	ROD for Ruston/North Tacoma Study Area issued.
1993	Unilateral Administrative Order for Ruston/North Tacoma Study Area issued.
1993	Final RI/FS reports for smelter cleanup submitted and approved.
1994	AOC for Ground Water, Surface Water, Soil and Marine Sediments monitoring and sampling signed.

¹ Amendments 1-4 for the AOC also included revised schedules for the performance of RI/FS work.

3.0 HIGHLIGHTS OF COMMUNITY PARTICIPATION

Throughout the studies leading up to this ROD, EPA has taken steps to inform and involve the public about activities at the Asarco Smelter site. EPA conducted the activities summarized in this section because the agency believes that community involvement in its decision making process is a key element in developing a successful cleanup plan.

In addition to cleaning up contamination at the Asarco Site, the community is very interested in the future use of the property. Although it is EPA's primary mission to design a cleanup plan that protects public health and the environment, EPA believes this can be done with future development of the Site in mind. Therefore, EPA has considered all comments related to the future of the Asarco Site when selecting cleanup actions.

In order to provide a variety of opportunities for public participation in the cleanup decision making process, EPA developed a communications strategy in 1993 for its activities related to the Asarco Site. This strategy supplemented the existing Community Relations Plan, which included all of the Commencement Bay Nearshore/Tideflats and South Tacoma Channel Operable Units.

This section summarizes the outreach activities that EPA has conducted to date. In addition to

the activities discussed below, EPA has complied with the specific requirements for public participation under CERCLA by publishing a Proposed Plan for public comment on August 12, 1994. The Proposed Plan was mailed to interested individuals and made available at local information repositories (listed in Table B-1 in Appendix B). The original public comment period ran from August 12 through October 11, 1994, and was extended until November 10 at the request of interested citizens. During the comment period EPA held two public meetings. In addition, a summary fact sheet was mailed to EPA's mailing list for the Asarco Site. EPA also published newspaper advertisements in the Morning News Tribune to announce the availability of the Proposed Plan, the comment period and the public meetings. Comments received during the public comment period are summarized along with EPA's responses in the attached Responsiveness Summary.

In addition to the public comment period, the following outreach activities were conducted by EPA:

Small Group Meetings. EPA staff members have attended meetings with groups upon request to share information about the agency's cleanup proposal, and to learn about different groups concerns and needs for information about the Site. These groups include: Black Collective Association; Izaak Walton League; Association of Builders and Contractors; Tacoma Environmental Commission; National Association of Women in Construction; Association of General Contractors; American Institute of Architects Southwest Washington; Environmental Task Force of Tacoma-Pierce County Chamber of Commerce; Kiwanis Club and Rotary Club.

EPA staff will continue to meet with small groups as requested.

Community Interviews. In November 1993 EPA staff met with individual citizens to understand better community concerns regarding cleanup.

Availability Sessions. In October, November and December 1993, EPA and Asarco held sessions where citizens could visit one-on-one with EPA and Asarco staff to discuss cleanup plans.

Community Workgroup Briefing. On May 19, 1994, EPA held a meeting for the Ruston/North Tacoma Community Workgroup. This workgroup was formed in 1989 to provide an avenue for citizens to become involved in residential investigation and cleanup activities. EPA presented a preview of its Preferred Cleanup Alternative at the meeting in order to get feedback and comments from the group.

Public Meeting. EPA held two public meetings during the 90-day public comment period on the Proposed Plan. At the meetings participants learned more about EPA's Proposed Plan and had the opportunity to provide public comments. Transcripts were taken of these two meetings (held August 30 and September 19, 1994) and are available in EPA's Administrative Record for the site.

Periodic Briefings. Briefings have been held for the Town of Ruston, City of Tacoma, Tacoma Environmental Commission, Congressman Dicks' Office and other interested local government officials.

Information Repositories. EPA has established and updates ten repositories where citizens can review detailed information about EPA's Superfund activities. New materials are periodically added to these repositories. Documents subject to public comment can also be found in these locations. The repositories are frequently advertised in fact sheets and in newspaper notices prepared by EPA.

Fact Sheets and Brochures. EPA prepares regular fact sheets for distribution to members of the community to provide current information on the status of site activities. Table B-2 in Appendix B, identifies a list of fact sheets and brochures published about the Asarco Site prior to this ROD.²

Coordinating Forum. In July of 1993, the Ruston/North Tacoma Coordinating Forum turned its attention to evaluating cleanup options for the Asarco Tacoma Smelter. The group was originally formed in March 1991 to facilitate discussion and coordination among the various entities involved and/or affected by the Ruston/North Tacoma Residential Study Area project.

² Fact sheets devoted exclusively to demolition activities are not included in this list.

In order to address issues associated with cleanup and future redevelopment of the Asarco smelter, the group formed two subcommittees: 1) land use, and 2) technical. The two committees worked for over a year on issues related to developing a cleanup plan for the smelter site. EPA participated directly in the technical subcommittee and received input from the land use committee. Input from both of these committees was instrumental to EPA in developing the Proposed Plan, which was published in August 1994. The following parties participated in the Forum subcommittees:

Land Use Subcommittee*:

Asarco
City of Tacoma
Metropolitan Parks District
Town of Ruston

* All land use subcommittee members were also represented on the technical committee.

Technical Subcommittee:

Agency for Toxic Substances and Disease Registry
Citizens for a Healthy Bay
Community Representative
Environmental Protection Agency
Puget Sound Air Pollution Control Authority
Puyallup Tribe of Indians
Tacoma-Pierce County Health Department
U.S. and State Fish and Wildlife Services

Washington Department of Ecology
Washington Department of Health
Washington Environmental Council

Technical Assistance Grant. In 1991 EPA awarded a Technical Assistance Grant (TAG) to the Citizens For A Healthy Bay. Citizens For A Healthy Bay have used these funds to have technical experts review and comment on cleanup design documents, prepare information for the general public on cleanup work, and prepare information for non-English speaking people who may fish or work on Commencement Bay. They have an office in downtown Tacoma which is open to the public and serves as an information repository for the Commencement Bay and Asarco Superfund sites. They also publish a quarterly newsletter which covers a wide-range on environmental issues associated with Tacoma.

4.0 SCOPE AND ROLE OF OPERABLE UNITS

Superfund response activities at the CB N/T Site currently are coordinated under seven separate OUs. Four of the OUs are related to the Asarco Superfund project. They are:

OU 02 - Asarco Tacoma Smelter
OU 04 - Asarco Off-Property (Ruston/North Tacoma)
OU 06 - Asarco Sediments
OU 07 - Asarco Demolition

The remedy described in this ROD addresses cleanup of OU 02, the Asarco Tacoma Smelter. It primarily involves the cleanup of metal-contaminated soils, slag, surface water and ground water. It also addresses the final disposal of demolition debris, the Expedited Response Action (ERA) soils and the Ruston/North Tacoma residential soils.

4.1 SCOPE OF CURRENT WORK

4.1.1 OU 02 - Asarco Tacoma Smelter

Based on its evaluation of human health and ecological risks associated with existing conditions

at the Asarco Site, EPA believes that current conditions on the Asarco Site pose unacceptable risks over the long-term to future potential workers, residents and visitors, and to the ground water discharging to Commencement Bay. Therefore, cleanup actions are necessary. EPA's goal is to reduce potential exposures to metal and organic contaminants by removing contaminated soils that act as source areas to the surface water and ground water, by capping the Site (soil and slag) surfaces and by armoring the slag shoreline. Soil removal or capping contaminated soils and slag is expected to reduce the contaminants that are carried into Commencement Bay by surface water and/or ground water and prevent direct contact with the soil and slag by humans and animals.

This ROD describes the final cleanup remedy for soil, Slag and surface water and disposal of hazardous soils, demolition debris and residential soils. This ROD is intended to be an interim action for ground water.

Site Development Planning

Concurrent with EPA's efforts to design a cleanup plan, Asarco, the Town of Ruston, the City of Tacoma, and the Metropolitan Park District formed a "land use committee" and hired consultants to help the group develop a Master Use Plan for future development of the Site after cleanup.

This effort involved significant citizen participation. Asarco and the land use committee held four week-long public forums called "Asarco Weeks" over an eight-month period to solicit ideas regarding the future use of the Asarco property. These efforts resulted in an "Agreement in Principle," negotiated by Asarco, the City of Tacoma, the Town of Ruston, and the Metropolitan Park District of Tacoma, that outlines a proposal for development of the Asarco Site, including responsibilities among the signatories for such development.

The "Agreement in Principle" adopts the "G-2.1" concept, the consensus approach resulting from the Asarco Weeks, and provides general guidelines for open space and development zones, such as commercial, residential, recreational, marine, and mixed uses, and for surface roadways. The G-2.1 concept provides for a park centered on the Site with a setback traffic center and a crescent-shaped development area fronting on grassy areas facing Commencement Bay. The park would tend from Ruston Way to Point Defiance Park.

Although the "Agreement in Principle" and this ROD are separate documents, they contain some common elements. They are separate because they represent different objectives and types of decisions regarding the smelter property. The purpose of the ROD is to document EPA's cleanup decision for the Site. Under the Superfund law, EPA has the authority to select and implement cleanup actions. In contrast, the "Agreement in Principle" outlines a proposal for development of the property after cleanup. The property owners, Asarco and the Park District, and the local governments with jurisdiction over the property, Tacoma and Ruston, have the authority to determine how the property can be used in the future after the cleanup has been completed.

4.2 OTHER RELATED ACTIVITIES

4.2.1 OU 04 - Asarco Off-Property (Ruston/North Tacoma Study Area)

The initial action for the Ruston/North Tacoma Study Area was an ERA. In March 1989, Asarco and EPA entered into an agreement for Asarco to conduct the ERA in the Ruston/North Tacoma Study Area. The AOC issued under Section 106(a) of CERCLA, required Asarco to clean up and cap 11 publicly accessible properties in Ruston. Contaminated soils excavated from all of the properties are stored temporarily at the Site in a building known as the "fine ore bins building."

In June 1993, EPA issued a ROD requiring that arsenic and lead contaminated soils in residential yards and in public right of ways surrounding the former smelter facility be excavated or capped and disposed off-site. In November 1993, an Explanation of Significant Difference (ESD) was available for public comment and was subsequently signed by EPA, allowing for temporary storage of the Ruston/North Tacoma residential soils on the north end of the former smelter property. The ESD provided for these soils to be left on the former smelter site until either the final Site remedy was selected or until December 31, 1994. EPA issued a Fact Sheet in December 1994 stating that, in general, the community supported disposing these soils on site as a sub-base for a cap and that these soils would remain on site until the final smelter remedy was selected.

By the end of 1994, 5 private properties had been cleaned up and 209 yards had been sampled.

4.2.2 OU 06 - Asarco Sediments

EPA issued a Supplemental Feasibility Study for the off-shore sediments in summer 1993. However, EPA, Ecology, Asarco, the Natural Resource Trustees and a community group believed that additional investigations and evaluation of the cleanup actions were necessary. In 1994, Asarco and EPA entered into an AOC requiring Asarco to collect and evaluate additional information regarding the off-shore marine sediments.

4.2.3 OU 07 - Demolition and Surface Water Controls

In November 1994, Asarco completed Phase II demolition of remaining Site structures under a federal Consent Decree signed in 1991 with EPA. Also under the Consent Decree, Asarco controls surface water that runs onto the Site to minimize the contact of surface water with contaminated soil in the cooling pond.

The remainder of this ROD discusses only the source control activities for cleanup of OU 02, the former Asarco Smelter, and the final disposal of demolition debris, the ERA soils and the Ruston/North Tacoma residential soils.

5.0 SUMMARY OF SITE CHARACTERISTICS

Under EPA's oversight, Asarco collected and analyzed soil, slag, surface and ground water, and sediment samples at the Site.

Soil. The following contaminants were found in soils on the Site at levels that were of potential concern to human health and the environment:

Metals

Antimony, Arsenic, Cadmium, Copper, Lead, Mercury, Silver, Thallium, Zinc

Organic Chemicals

Polyaromatic Hydrocarbons (PAHs) and Polychlorinated Biphenyls (PCBs)

These contaminants in soil are of concern because (1) they are the primary source of contamination to ground water and surface water that is flowing into Commencement Bay; and (2) they are a potential health concern for humans and animal life that be exposed to the contaminants in the soil now or in the future.

Samples show that the principal threats to human health and the environment posed by the Asarco Site are the contaminated materials in the six "source areas" identified on Figure 1-1.

These are areas that have either the highest measured concentrations of contaminants in the soils, appear to act as the primary known sources of contamination to ground water and surface water, and/or have large amounts of contaminated material based upon the historic uses of these areas.³ These areas are the:

- Stack Hill
- Copper Refinery Area
- Cooling Pond
- Fine Ore Bins Building
- Arsenic Kitchen
- Southeast Area of the Plant

³ For example, the highest concentration of arsenic found in soil is 403,100 parts per million (ppm) near the arsenic kitchen area. This level is approximately 130 times higher than the highest concentration found in Ruston. The highest concentration of arsenic in ground water is located in monitoring well 111 with 52 ppm (.006 parts per million is EPA's preliminary remedial action objective). This monitoring well is down-gradient from the arsenic kitchen and fine ore bins area. See Table 3 for maximum concentrations of chemicals of concern.

Soil and groundwater concentrations in the source areas are identified for both arsenic and copper in Tables B-3 and B-4, respectively, in Appendix B.

In addition to these six areas, elevated concentrations of metals were detected in soils and slag throughout the entire property. Even though certain areas are not considered principal threats to ground water, the concentrations generally are high enough throughout the Site to pose a threat if they are inhaled, ingested, or touched by people or animals.

Slag contains high concentrations of metals, including arsenic and lead, in a rock-like form. Concentrations of arsenic found in slag ranged from 100 to 24,950 ppm. The slag along the smelter shoreline is a poured matrix. The slag found on the slag peninsula is primarily fine grained, sand-like particles. The slag portions on the Site appear to contribute less contamination to ground water than the source areas described above. Slag poses a threat if ingested by people or animals. In addition, the fine slag particles on the peninsula are blown into Commencement Bay and potentially into the recreational areas of the Yacht Basin and Point Defiance Park.

The face of the slag shoreline appears to be impacted by the tidal activity in Commencement Bay. High energy currents and wave action cause erosion of the slag, which results in slag particles moving from the shoreline and being deposited into the off-shore sediments. Recently, a shoreline monitoring station was washed away.

Surface water samples were collected from seeps (ground water that surfaces from hillsides or in the tunnel), puddles, and at the outfalls that discharge into Commencement Bay. Asarco found that surface water on the Site, including seeps and small stagnant pools below the stack hill and in the arsenic kitchen area, and water in the cooling pond, is contaminated with metals at levels higher than federal or state standards for drinking water and for protection of sea life. The contaminants that exceed regulatory levels include arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel selenium, silver zinc, total petroleum hydrocarbons, and anilines.

The surface water investigation showed that the surface water drainage system on the Site is no longer adequate. The pipes and drains associated with the system may be cracked and/or the pipes filled with contaminated sediments. Surface water can become contaminated by contact with the contaminated sediments in the pipes. The contaminated surface water can then leak out of the system and migrate to ground water or discharge to Commencement Bay.

Ground Water. Three water-bearing zones (groundwater aquifers) were identified at the smelter property. The two shallowest aquifers, the slag and marine sands aquifers, show elevated levels of arsenic, copper, zinc, and other metals. A thick silt barrier between the shallow and deeper aquifers seems to have protected the deeper aquifer, the Pre-Vashon aquifer, from contamination. Only a few water samples from the deeper aquifer have elevated metal concentrations. The few exceptions may result from contamination migrating through a production well, which was drilled into the deeper aquifer during the smelter's operation. This well has now been plugged so that contamination is unlikely to continue migrating from this well into the deeper aquifer.

The three primary ways for metals to move into ground water are: (1) clean or contaminated surface water moving through contaminated soil into ground water; (2) contact between ground water and soil or slag that releases metals into ground water; and (3) leakage and spills, for example, from former process operations such as ore handling, storage, or refining, and from the existing sewer and drainage system.

Organic contamination caused by dimethylaniline (DMA) that was used in the production of sulfuric acid has been identified in the southeast corner of the smelter property. Wood debris and sawdust, left over from sawmill operations and now buried beneath the slag, are decomposing thus contributing to the release of metals, particularly arsenic, from the slag into ground water and Commencement Bay.

The metal levels in ground water decrease as ground water moves through the smelter property towards Commencement Bay. This decrease in contamination may be due to: (1) seawater or groundwater dilution; (2) metals adhering to the slag as ground water moves towards the bay; (3) metals being removed from the ground water through chemical reactions; or (4) the contaminant plume moving slowly through the smelter property.

The contaminants that exceed regulatory levels for ground water entering the bay are: arsenic, beryllium, cadmium, copper, lead, mercury, nickel, selenium, silver, zinc, total petroleum hydrocarbons, and anilines.

Air. Samples of dust were collected at 22 smelter property locations. A model was used to predict how much dust would move into the communities of Ruston and Tacoma if there were no cleanup. The results showed that the highest emissions would be on the smelter property and that emission levels decrease rapidly with distance from the smelter property.

6.0 DESCRIPTION OF SITE RISKS

This section of the ROD provides a brief summary of the "On-Property Human Health Risk Assessment" ('Risk Assessment') for the Asarco Tacoma Plant (Kleinfelder 1993). The document was prepared by Asarco, with EPA oversight, to assess the potential human health risks from Site contamination and was completed according to national and regional EPA risk assessment guidelines. It evaluates potential risk from exposure to contamination in soil, slag, surface water, ground water and air if no remedial action is taken on the site. The results of this assessment were used to decide whether remedial action is appropriate and which exposure pathways and contaminants require remediation.

OVERALL SUMMARY OF RISK ASSESSMENT

Potential health impacts were estimated using the risk assessment and assuming five possible land-use scenarios for the Site: residential, industrial, commercial, recreational and the existing non-use. The result showed that the estimated cancer risks and non-cancer health effects from the Site are the highest for possible future residents who may inadvertently ingest soils or drink ground water at the site. For example, it was estimated that the lifetime chance of developing cancer from ingesting soil in the arsenic kitchen area, assuming residential use (e.g., daily ingestion of soil, a 70 kilogram adult, living on the Site for 30 years), may be as high as two in ten. Repeatedly ingesting soil in the stack hill area may pose a chance of four in a hundred of getting cancer. An unacceptable excess lifetime cancer risk for Superfund cleanups is in a range of approximately one in ten thousand to one in a million. Non-cancer impacts from the Site are likely to present appreciable risk of significant adverse effects to people over lifetime exposures (generally referred to as a hazard index (HI) greater than one).

Residential land use poses the highest potential for health impacts because it assumes that people will spend the most time at the property and therefore potentially be more exposed to contaminants. Other land use possibilities, such as recreational, industrial, commercial, and non-use, assume people will spend less time at the Site and have lower exposures to Site contaminants. Therefore, these other scenarios are estimated to have less potential for health impacts.

Arsenic exposure is responsible for most of the estimated cancer risk from contaminants in soil, slag, ground water and surface water at the Site. Arsenic levels in the surface water and ground water that is discharged to the Bay substantially exceed EPA's water quality criteria for fish ingestion by people, and state standards that protect marine life. Antimony, arsenic, chromium, copper, lead, manganese, and mercury are some of the chemicals of most concern for non-cancer effects such as organ damage, learning disabilities, and birth defects. A detailed discussion of all of the assumptions and the estimated numerical health impacts associated with each pathway can be found in the Risk Assessment report.

Risk assessments are performed using information on the toxicity of contaminants and assumptions regarding the extent to which people may be exposed to them. This summary of the Asarco Risk Assessment is divided into five sections: (6.1) identification of contaminants of concern (COCs), (6.2) exposure assessment, (6.3) toxicity assessment, (6.4) risk characterization, which is an integration and summary of the information gathered and analyzed in the preceding sections, and (6.5) analysis of the uncertainty involved in developing a risk assessment. In addition, Section 6.6 is a summary of the qualitative ecological risk assessment (EPA 1993).

6.1 IDENTIFICATION OF CONTAMINANTS OF CONCERN (SCREENING ANALYSIS)

The selection of chemicals that potentially contribute to risks to human health at the Site, known as the COCs, was a two-step process. First a screening evaluation was done comparing the

maximum chemical concentrations in soil, ground water, and air with conservative health based concentrations and/or with appropriate criteria and standards. The chemicals selected in this first step were then evaluated, taking into account each chemical's frequency of detection, toxicity, persistence and mobility, in order to select the final COCs in each media. These are shown in Table 6-1.

Chemicals selected for soils, Class IIB ground water (potential drinking water) and air shown in Table 6-1 were selected using exposure parameters based on residential use of the Site.

Water from Class III wells is not suitable for drinking, it contains contaminants and can migrate into the bay. The COCs for Class III ground water were selected base upon the potential for humans to be exposed to these contaminants through consumption of seafood from the bay. Five metals were selected: arsenic, beryllium, lead, manganese and mercury.

All of the metals selected as COCs in ground water and soil were selected as COCs in surface water. Arsenic and lead were selected as COCs of concern in slag based upon information from the Ruston/North Tacoma Risk assessment.

6.2 EXPOSURE ASSESSMENT

The exposure assessment estimates the type and magnitude of exposures to the COCs at the Site. It considers the current and potential future uses of the site, characterizes the potentially exposed populations, identifies the important exposure pathways and quantifies the intake of each COC from each medium for each population at risk. The result of the assessment is a calculated daily dose of each COC per body weight for each exposure medium.

6.2.1 Identification of Site Uses, Exposed Populations and Exposure Pathways

Site Use Scenarios. The exposure assessment for the Asarco Site considers five land-use scenarios involving different groups of potentially exposed populations. Of the five land-use scenarios considered, one represents the current use or "non-use," and four represent projected future uses: residential, commercial, heavy industrial, and recreational.

Potentially Exposed Populations. Each scenario described above has an associated population that may be exposed to COCs at the site. The populations assumed for each of the site uses are described below.

- (1) Non-Use. Currently, the Site is not being used for any purpose other than for site investigation, monitoring and demolition. For this existing use scenario, potentially exposed populations are maintenance workers, guards, trespassers and nearby residents who may be exposed to dust from the Site.
- (2) Residential. The Site would be developed for residential use. People would spend 30 years of their lifetime on the Site.
- (3) Heavy Industrial. The Site would be developed for industrial purposes. Workers would spend 25 years of continuous employment at the Site.
- (4) Recreational or Park. All or part of the Site would be developed as a park. Visiting children and adults would be exposed to Site contaminants.
- (5) Commercial. Part or all of the Site would be redeveloped for commercial uses including office buildings and shops. Office workers and merchants would be the primary exposed populations.

TABLE 6-1. CONTAMINANTS OF CONCERN FOR SOIL, GROUND WATER AND AIR

Chemical	Soil	Drinking Water	Ground water Impacting the Bay	Air
Antimony	N	N		
Arsenic	C/N	C/N	C/N	C/N
Beryllium		C/N	C/N	
Cadmium	C/N	C/N		C/N
Chromium		C/N		C/N
Copper	N	N		
Lead	C/N	C/N	C/N	C/N
Manganese		N	N	
Mercury	N		N	N
Nickel		C/N		C/N
Selenium				
Silver	N	N		
Thallium	N			
Zinc	N			
Polycyclic Aromatic Hydrocarbons	C			
Polychlorinated Biphenyls	C			

C Cancer Causing Chemical
 N Chemical Causing Non-Cancer Health Effects
 C/N Chemical Causing Both Cancer and Non-Cancer Effect

Exposure Pathways. An exposure pathway is the mechanism by which chemicals migrate from their source or point of release to the population at risk. Four elements comprise a complete exposure pathway: (1) a source of a chemical release (e.g., contaminated soils); (2) movement of contaminants through environmental media (e.g., rain moving through contaminated soil into ground water); (3) a point of potential human contact with a contaminated medium (e.g., use of contaminated ground water for drinking water); and (4) entry into the body or exposure route (e.g., ingestion of drinking water).

The exposure pathways considered for the Risk Assessment varied depending on the land use being considered and on the population potentially exposed. For example, in assuming future residential land use of the Site, the following exposures were evaluated for adults and children: (1) ingestion of slag, soil, and dust; (2) dermal exposure to soil and dust; (3) ingestion of vegetables potentially contaminated by soil contaminants; (4) inhalation of contaminants in the air as a result of dust resuspension from the site; (5) ingestion of potable ground water on the Site; and (6) ingestion of contaminated surface water in pools and seeps on the Site.

In contrast, the potential exposures considered for a site maintenance worker under the current non-use scenario were: (1) ingestion of soil, dust, and slag; (2) dermal exposure to soil and dust; and (3) inhalation of contaminants in dust.

6.2.2 Calculation of Exposure

EPA's Superfund guidance requires that the reasonable maximum exposure (RME) be used to calculate potential health impacts at Superfund sites. The RME is the highest exposure that is reasonably expected to occur at the site. It is calculated using conservative assumptions in order to represent exposures that are both reasonable and protective. In the Risk Assessment, RMEs were estimated for the land-use scenarios and exposure pathways described above (see Table B-5 in Appendix B for the RME exposure assumptions for potential residential use). For the residential scenario, average exposures were calculated in addition to the RMEs to represent exposures of a more typical person.

To estimate exposure, data on the concentrations of COCs in the media of concern at Site (the exposure point concentrations) are combined with information about the projected behaviors and characteristics of the people who may potentially be exposed to these media (exposure parameters). These elements of the Asarco Site are described below.

Exposure Point Concentrations: The Site was divided into six areas to calculate the contaminant levels for estimating exposure because the Site is large, the types and concentrations of contaminants vary by area, and there are several possible future land-use scenarios, see Figure 6-1. The areas are (1) the administrative area; (2) arsenic kitchen area; (3) cooling pond area; (4) stack hill area; (5) off-plant area; and (6) general plant slag area. Section 3.0 of the Risk Assessment presents details on the calculations and use of these exposure point concentrations.

Parameters: The parameters used to calculate the RME include body weight, age, contact rate, frequency of exposure and exposure duration. Exposure parameters provided in EPA Superfund guidance were used when available (i.e., for the residential and heavy industrial land uses). Parameters for the other land uses were developed for the Asarco Site using best professional judgement.

For all of the media, except surface water, exposures were estimated assuming long-term exposures to site contaminants (e.g., 30 years of daily use for residential use, 350 days/year, and 25 years, 8 hours/day for 5 days/week, for heavy industrial use). Potential risk from surface water was calculated assuming that a child accidentally consumes water that has puddled on the Site. Since there were no data on contaminant levels in Commencement Bay for fish, potential risks from the consumption of fish and shellfish were estimated by comparing the levels of contaminants in selected shoreline wells with EPA's WQC for protection of human health from fish consumption.

6.3 TOXICITY ASSESSMENT

The purpose of the toxicity assessment is to provide, where possible, an estimate of the

relationship between the extent of exposure to a contaminant and the increased likelihood and/or severity of adverse effects. This is done by weighing available evidence regarding the potential for particular contaminants to cause adverse effects in exposed individuals.

EPA has conducted toxicity assessments for many chemicals and publishes the resulting values, slope factors (Sfs) and reference doses (RfDs), on the Integrated Risk Information System (IRIS) or in the Health Effects Assessment Summary Tables (HEAST). With the exception of lead, which is assessed using the integrated uptake/biokinetic model (IUBK) developed by EPA, IRIS and HEAST were used as a source for Sfs and RfDs.

Sfs have been developed for estimating upper-bound excess lifetime cancer risks associated with exposure to potential cancer-causing chemicals. They are expressed in units of the inverse of milligrams per kilogram of body weight per day (mg/kg-day)⁻¹. S/S are derived from the results of human epidemiological studies or chronic animal bioassays to which mathematical extrapolations from high to low dose and from animal to human have been applied, see Table B-6 in Appendix B.

RfDs have been developed to indicate the potential for adverse health effects from ingestion of COCs that exhibit non-cancer effects, such as damage to organ systems (e.g., the nervous system, blood forming system, etc.) and learning disabilities. They are expressed in units of mg/kg-per day. RfDs are estimates within an order of magnitude, of lifetime daily exposure levels for people, including sensitive individuals, that are likely to be without risk of adverse effect. Estimated contact with contaminant(s) of concern from environmental media can be compared to the RfD (e.g., the amount of a contaminant(s) of concern ingested from drinking water or soil in mg/kg/day). Reference concentrations (RfCs) are used to indicate potential non-cancer health impacts from inhalation (usually expressed in milligram per cubic meter), see Table B-7 in Appendix B.

The standard non-cancer risk assessment method described above was not used for the assessment of lead in soil. For the residential scenario, EPA guidelines specify the use of the IUBK model for estimating acceptable lead levels in soil. EPA guidance recommends that soil lead concentrations should be low enough to ensure that blood lead levels do not exceed 10 micrograms per deciliter in 95% of the potentially exposed children. The IUBK model predicts a value of 500 ppm of lead in soil to meet this goal. The exposure point concentrations calculated for lead in soil at the Site were compared to this value of 500 ppm to assess its potential non-cancer impacts.⁴

⁴ Since the Risk Assessment was completed, the IUBK model has been revised. The most recent version of the IUBK model results in lead levels of 400 ppm. EPA does not believe that this significantly alters any of the conclusions in the Risk Assessment and does not have an impact upon any Site cleanup decisions.

6.4 RISK CHARACTERIZATION

Risk characterization is an integration and summary of the information gathered and analyzed in the preceding sections. Site-specific exposure estimates were combined with cancer Sfs and RfDs to assess potential health impacts.

To estimate cancer risk, the Sf is multiplied by the exposure expected for that chemical to provide an upper-bound estimate of the excess lifetime cancer risk. This estimate is the incremental probability of an individual developing cancer over a lifetime as a result of exposure to cancer-causing chemicals at a site.

The potential for non-cancer health impacts is evaluated by dividing the exposures calculated for each COC at the site by its RfD or RfC. The result is the Hazard Quotient (HQ). By adding the HQs for all contaminants via one exposure pathway, the HI is calculated.

The results of the Risk Assessment show that the estimated cancer and non-cancer impacts from exposure to Site contaminants in soil vary with the Site areas and with the projected future land-use. The estimated lifetime cancer risk from ingesting soil in the arsenic kitchen area, assuming residential land use, may be up to two chances in ten (2 in 10). Cancer risks in the

other five areas of the Site, assuming residential land use, range from about 4 chances in 100 to 2 chances in a 1,000. These risks are lower primarily because contaminant levels are high in the arsenic kitchen area than in the rest of the Site.

Residential exposure to soils in the arsenic kitchen area is estimated to result in an excess cancer risk of 2 chances in 10, but the risks for the other possible site-uses (industrial, commercial, recreational and non-use) in the arsenic kitchen area range from 5 chances in 100 to 2 chances in 1,000. Residential use assumptions result in the highest risks because exposures occur more often and over longer periods of time, more exposure routes are possible and children have higher exposures than adults.

Cancer risks vary by route of exposure. For example, for residential exposures in the arsenic kitchen area, ingestion of soil contaminants results in the highest cancer risk (2 chances in 10) followed by exposure to contaminants in drinking water (about 4 chances in 100), eating vegetables (3 chances in 1,000), inhaling contaminants in dust (5 chances in 10,000) and dermal exposure to soils (5 chances in 100,000), see Figure B-1 in Appendix B.

According to the National Contingency Plan, which governs Superfund cleanup, if the cumulative cancer risk on a site is greater than approximately 1 in 10,000, a cleanup action is generally taken.

The estimated HI, which is used to evaluate non-cancer impacts, is 806 in the arsenic kitchen area assuming soil ingestion and residential land-use. HIs in this area for other land uses range from 7 to 205, see Figure B-2 in Appendix B. The HI for ground water ingestion in the arsenic kitchen area assuming residential land use is 219. HIs above 1 are used in the Superfund program to indicate that site remediation may be necessary.

Arsenic is responsible for the majority of the cancer risk at the Site. Several metals, including arsenic, lead, and copper are responsible for the non-cancer impacts at the Site.

Exposures to arsenic, copper and lead in site surface water may result in acute hazard to children who swallow this surface water. The concentrations of four metals, arsenic, mercury, manganese and beryllium, in Class III ground water near the bay are in excess (above a 1 in 10,000 cancer risk or above RfDs) of EPA's water quality criteria for protection of human health from fish consumption. Aniline is in Class III ground water at concentrations that exceed a risk of 1 in 10,000 assuming fish consumption.

Although the Risk Assessment did not include an evaluation on the adjacent slag peninsula, potential health impacts in this area are expected to be similar to those in Area 6, the general plant slag area. Area 6 was evaluated in the Risk Assessment for arsenic exposure. Assuming residential exposures, cancer risk in Area 6 may be as high as 2 in 1,000 and the HI is above 1. Therefore, both the slag peninsula and the general plant slag area contain arsenic at levels that may result in cancer and non-cancer risks above Superfund levels of concern.

6.5 UNCERTAINTY ANALYSIS

The numerical results of a risk assessment (HQs and cancer risk values) are uncertain because of limitations in knowledge regarding exposure and toxicity. Where information is incomplete, assumptions must be made: the greater the uncertainty, the more conservative the assumptions to be protective of public health. Even when actual characteristics of a population are known, selected exposure parameters are biased toward over-estimating rather than under-estimating risk for the majority of the population. A discussion is presented below on how uncertainties in the risk assessment process might overestimate or underestimate risk.

Some of the factors that may lead to a possible overestimation of risk are as follows:

- (1) The majority of the soil samples were collected in areas of the Site thought to be contaminated based on past smelter operations, so the whole Site might not be as contaminated as these samples indicate;
- (2) Because of a lack of information, the exposure parameters (e.g., exposure frequency and duration) used in the risk assessment are derived in a conservative manner;

- (3) EPA assumes that there is a cancer risk associated with all exposures to cancer-causing chemicals and that this risk increases as exposure increases. This assumption may not be true for all carcinogens;
- (4) RfDs are developed from animal data using uncertainty factors to take into account the differences between animals and people and the differences in experimental versus environmental exposures. For some chemicals, these uncertainty factors may be overly conservative.

Conversely, there are factors that may lead to a possible underestimation of risk. Some of these factors are as follows:

- (1) Some of the unsampled areas of the site may have higher concentrations than those areas sampled;
- (2) Soil exposure assumptions were made using surface soil concentrations; some subsurface soils on the Site have contaminant levels that are higher;
- (3) The lack of data available for the derivation of exposure factors and toxicity factors (Sfs and RfDs) could result in factors that are too low, although the use of uncertainty factors makes this unlikely;
- (4) Estimated cancer risks for arsenic, which is the contaminant of greatest concern at the Site, may be too low. They were evaluated using the Sf in the IRIS data base, which takes into account only arsenic's ability to cause skin cancer although more recent analyses have shown that arsenic ingestion can also elevate risks of internal organ cancers; and
- (5) Contribution of site contaminants to fish ingestion exposure by surface water run-off, outfalls, sediments or existing contaminants in the Bay from past Site discharges were not evaluated.

For more detail regarding uncertainty, see Section 6.0 of the Risk Assessment.

6.5.1 Comparison of the Risk Assessment Results to Superfund Regulations and Guidance

The results of the Risk Assessment are evaluated to determine if the Site needs to be cleaned up and what cleanup actions are warranted. This evaluation is made by determining whether the cancer risks and the non-cancer health impacts exceed those considered to be of concern to EPA's Superfund program as defined in EPA's National Contingency Plan (NCP) and "Role of the Baseline Risk Assessment in Superfund Remedy Selection Decisions," April 22, 1991, OSWER Directive No.9355.0-30.

Where the cumulative carcinogenic site risk to an individual based on RME for both current and future land use is less than approximately one in ten-thousand, and the non-cancer causing HQ is less than 1, cleanup on a site is generally not warranted unless there are adverse environmental impacts. As described above in the risk characterization section, the cancer risks and HIs calculated were in excess of these two criteria. Based on the results of the Risk Assessment, EPA has determined that cleanup is necessary at the Site.

6.6 ECOLOGICAL RISK ASSESSMENT

EPA developed an Ecological Risk Assessment to assess the impacts of contamination on sea life, plants and pets. EPA based its assessment on available literature and Site-related data. The assessment suggests that the metals in soils may have an impact Site vegetation. Based on exceedances of federal and state water quality criteria in ground water and surface water and exceedances of state sediment quality criteria in off-shore sediments, sea life in the off-shore sediments have been adversely affected by releases from the Site.

Cleanup actions are necessary because current conditions at the smelter property and on the slag peninsula pose unacceptable long-term risks for current workers, possible future visitors or residents, and sea life and animals. EPA is recommending a comprehensive cleanup strategy in order to address the multiple sources of contamination at the smelter property and slag peninsula. EPA's objectives for the cleanup are identified in Table 6-2. The performance standards for the selected remedy are found in Section 9.

EPA will accomplish its cleanup objectives at the smelter property and slag peninsula in two phases. The first phase, which is described in this ROD, includes activities to control continuing sources of contamination at the smelter property and slag peninsula. These "source control" activities will remove or control portions of the property that are known to be contributing to the contamination of surface water and ground water. Such activities will also minimize possible exposure to contamination via direct contact, and therefore further reduce Site risks.

The second phase could include additional active clean up measures, if necessary, to restore surface water or groundwater quality and will be described in a subsequent ROD. An example of an active measure would be installing a groundwater pump and treat system at the Site. Further active measures would not be necessary if ground water or surface water clean up levels are achieved as a result of the source control measures. In this case, a "no-action" ROD would be issued.

Although sampling of ground water has been conducted since 1987, EPA believes that the following significant uncertainties remain regarding how contaminants move into and through the ground water at the smelter property.

- Impacts of clean up actions on groundwater quality.
- Extent to which concentrations of contaminants in the ground water are naturally being lowered through chemical reactions currently taking place in the groundwater.
- Extent to which dilution by seawater or ground water may also be reducing concentrations of contaminants.
- Loadings of contaminants (for example, kilograms per day) discharged to Commencement Bay via groundwater pathways.

EPA will continue to require monitoring of ground water to provide a better assessment of ground water conditions, an evaluation of the effectiveness of soil and surface water clean up actions on groundwater quality and an evaluation of the practicability of groundwater remedial measures.

TABLE 6-2. CLEANUP OBJECTIVES

CONTAMINATED SOIL, DUST AND SLAG

- (a) Prevent ingestion and inhalation of contaminated soils slag and dust containing contaminants in concentrations above applicable or relevant and appropriate requirements (ARARs) or above risk-based goals when ARARs are not available or protective;
- (b) Reduce releases of contaminants from soil to ground water by:
 -) Removing the source areas where contaminants leach from soil to ground water
 -) Limiting the surface water that runs into soil and slag;
- (c) Limit the erosion of slag to the off-shore sediments.

ON-SITE GROUND WATER AND SURFACE WATER

- (a) Prevent ingestion of potable (Class IIB) ground water and On-site surface water (e.g., seeps, puddles) containing contaminants above ARARs or above risk-based levels when ARARs are not available;
- (b) Reduce contact between contaminated soil, slag or fill and surface water and ground water.

GROUND WATER, SURFACE WATER, AND TREATED WATER DISCHARGED TO
COMMENCEMENT BAY

- (a) Reduce discharge to Commencement Bay of contaminated waters containing contaminants in concentrations above ARARs or risk-based goals when ARARs are not protective or not available;
- (b) Reduce leaks and spills of contaminated surface water from drainage and sewage systems.

Asarco's Feasibility Study (FS) identified a range of alternatives to achieve the clean up objectives and remediation goals for the smelter property and slag peninsula (Table 7-1). The alternatives represent significantly different approaches to cleanup the Site and protect human health and the environment. The alternatives are different, for example, in terms of their effect on the contamination, what is necessary to maintain their effectiveness, and their cost.

The range of alternatives presents several choices for cleaning up contamination at the Site. EPA decided among the choices in order to select the cleanup remedy for the Site.

In addition to the various cleanup alternatives identified below, demolition of the remaining buildings and structures on the Site and use of the Ruston/North Tacoma residential soils as a sub-base for the Site wide cap were evaluated. In addition to the cleanup alternatives selected, long-term operation and maintenance of the cleanup activities and coordination with Site redevelopment is necessary.

The following section summarizes the cleanup activities under each of the FS alternatives and their estimated costs.

7.1 SUMMARY OF ALTERNATIVES

Plant Site-Soils (and Slag Peninsula)

Several cleanup alternatives were evaluated in the FS for plant site soils (PSS), slag at the plant site, and the slag peninsula.

PSS-1 is "no action." This alternative means that no further cleanup actions would be performed. This alternative is included to serve as a baseline for the evaluation of other alternatives.

PSS-2 is "limited action" and would focus on restricting access to the Site by fences with warning signs and deed restrictions to prohibit wells from being drilled into contaminated ground water and future use or development on the Site. The estimated cost of this alternative (capital plus operation and maintenance) for both PSS and the slag peninsula is \$1.5 million and the estimated time to install fencing and warning signs is one month (\$1.5 million and one month).

PSS-3 includes two types of caps for the plant site and slag peninsula and three different possibilities for excavation and disposal of soil. In general, the purposes of a cap are to prevent the direct contact of people, animals, and surface water with contaminated soils and slag, to prevent contaminated soil from being wind-blown, and to reduce movement of soil contaminants through surface water into ground water. A cap can also be used to make drainage/grade improvements and to prevent contaminated surface water from pooling on the Site.

Caps:

PSS-3A A low permeability (10⁻⁷ seconds/centimeter) asphalt cap on areas of the plant site and the slag peninsula that are not currently paved (\$6.3 million and three months).

PSS-3B Soil cap over entire plant site and the slag peninsula that includes a Ruston/North Tacoma residential soils sub-base, low-permeability clay layer, gravel drainage layer, and clean topsoil, see Figure 7-1 (\$7.6 million and five to seven years).

Excavation/Disposal:

PSS-3C Excavate soil and granular slag from the source areas (see Figure 1-1); dispose of materials, together with demolition debris and Study Area soils, in an OCF, a hazardous waste landfill with a low permeability liner and cap, leak detection, collection and removal system, leachate collection and removal system and surface run-on and run-off control systems, located in the current parking lot, see Figure 7-2. (\$23.5 million and seven years).

PSS-3D Same as PSS-3C but dispose excavated materials in an OCF located in the plant slag area (\$23.7 million and seven years).

PSS-3E Excavate, treat, and dispose source area soils and demolition debris in an off-site hazardous waste landfill (\$75 million and six months).

Estimates of Materials To Be Excavated (in cubic yards)*

•	Arsenic Kitchen	62,000.00
•	Cooling Pond	18,100.00
•	Stack Hill.	54,000.00**
•	Copper Refinery	14,050.00
•	Fine Ore Bin.	9,850.00
•	Demolition Debris	82,000.00
	 SUBTOTAL	 240,000.00
•	 Residential Soils	 187,000.00
	 TOTAL	 427,000.00

* The Southeast Area of the Plant is not included because it is not practicable to excavate the wood debris buried in slag that is contaminating the ground water, see Section 8 - Implementability.

** This estimate includes 39,700 cubic yards from and around the car and railroad tunnels.

TABLE 7-1. CLEANUP ALTERNATIVES

Plant Site Soils (PPS)

- PSS-1 No Action (used for comparison).
- PSS-2 Limited Action (fences and warning signs).
- PSS-3 Capping and/or Soil Excavation
- PSS-3A Asphalt cap over unpaved areas on Site and slag peninsula.
- PSS-3B Soil cap over entire Site and slag peninsula.
- PSS-3C Excavate soil from some areas and dispose in OCF in parking lot.
- PSS-3D Excavate Soil from source areas and dispose in OCF in plant slag area.
- Bermed structure in parking lot.
 - Three linear concrete cells with vertical walls in NE arsenic kitchen area.
 - Circular concrete tank, 525 feet in diameter in arsenic kitchen area.
 - Circular bermed structure, 600 feet in diameter, in NE arsenic kitchen area.
- PSS-3E Excavate soil from source areas, treat and dispose in offsite landfill.
- PSS-4 Treating Soil from Source Areas:
- PSS-4A Treat soil, put back treated soil in excavated areas, dispose demolition debris in OCF.
- PSS-4B Treat soil, dispose treated soil in offsite landfill, dispose demolition debris in OCF.

Surface Water (SW)

- SW-1 No Action (used for comparison).
- SW-2 Monitoring Program
- SW-3 Cleanup Existing Surface Water Drainage System:
- SW-3A Repair leaks and abandon unused portions.
- SW-3B Abandon entire system. Construct new drainage system.
- SW-3C Slip line existing pipes.
- SW-3D Re-route surface water to alternate outfalls.
- SW-4 Collect and Treat Surface Water.

Shoreline Armoring

- Riprap (place rocks on shoreline).
- Artificial beach nourishment (sand and gravel).

Ground Water and Marine Sediments

- Additional monitoring and sampling.

Additional On-Site Disposal Alternatives:

After completion of the FS, Asarco submitted further alternatives for constructing an OCF with a capacity of 240,000 cubic yards as follows:

- Bermed structure in the parking lot built into the hillside and bermed on three sides (estimated cost is \$18 million), or
- Three concrete cells in a row with vertical walls located northeast of the arsenic kitchen area. The approximate size of each cell is 200 by 1200 by 45 feet high (\$32 million), or
- Circular concrete tank, about 525 feet in diameter, located northeast of the arsenic kitchen area (\$22 million), or
- Circular bermed structure, about 600 feet in diameter, located northeast of the arsenic kitchen area (\$22 million).

Soil Treatment:

The two PSS-4 alternatives involve treatment of contaminated soils at the plant site using chemical fixation and disposing of them in different locations. Chemical fixation means mixing excavated contaminated materials with cement and lime in order to reduce the mobility of the contaminants.

PSS-4A Put back treated soils in excavated areas on-site and cover the area with a cap. Demolition debris would be disposed in an OCF (\$48.2 million and six months).

PSS-4B Dispose of treated soils in an off-site landfill and demolition debris in an OCF (\$86.4 million and six months).

Surface Water

Several cleanup alternatives were evaluated to address contaminated surface water at the Site.

SW-1 is no action.

SW-2 relies on soil removal and groundwater remediation to reduce the release of contaminants (for example, arsenic) to surface water. A surface water monitoring program would evaluate the effectiveness of this approach. The estimated cost of the monitoring program is \$943,000 and the estimated duration is ongoing.

SW-3 consists of four different measures with respect to the existing surface water drainage system:

SW-3A Repair leaks in the existing system; ongoing maintenance to prevent leaks in the future; plug and abandon portions of the existing system not used (\$737,000 and three months).

SW-3B Plug and abandon the entire existing system. Construct new drainage system, including pipes, inlets, and manholes, that prevents leaks and resists corrosion (\$1.6 million and 3 months).

SW-3C Insert smaller PVC pipe (or slip lines) into existing pipelines; seal existing drains and sumps and manholes; replace open ditches with new pipes (\$969,000 and three months).

SW-3D Re-route surface water that runs onto the Site to alternate drain outfalls (\$439,000 and two months).

SW-4 would collect and treat contaminated surface water in a water treatment plant located on the plant site (\$23.6 million and ongoing).

Shoreline Armoring

The most effective measure to prevent erosion of the slag shoreline into Commencement Bay is called shoreline armoring.

There are two main types of armoring:

- Line the shore along the smelter property and the slag Peninsula with riprap (large rocks) underlain with 2 feet of smaller rock, see Figure 7-3. Riprap would not be installed on the interior portion of the slag peninsula because of the minimal slag erosion which occurs there (\$6.2 million and from six to twelve months).
- Use artificial beach nourishment, which consists of depositing sand and gravel to form a pebble beach. Sand and gravel that erodes would need to be replaced on an annual basis (\$1.4 million and two months for beach nourishment).

Mitigation for damage caused to natural resources (e.g., intertidal habitat) would be required for either of these options. The full extent and design of armoring is presently unknown, so the cost to complete mitigation (e.g., replacement of damaged resources) is not estimated. The time to complete mitigation could be up to 2 years, which could be done concurrently with or immediately after shoreline armoring.

7.2 SIGNIFICANT PUBLIC COMMENTS AND ADDITIONAL ANALYSES

EPA received many comments on its Proposed Plan for cleaning up the site. These comments are responded to in the Responsiveness Summary (Appendix A). In this section, EPA summarizes some of the most significant technical comments and describes the additional analyses that EPA conducted in response to such comments.

7.2.1 On-Site Containment Facility Comments

Several commenters recommended that if the OCF were selected, it should be comprised of multiple cells holding different concentrations of contaminated soil. The reasons given for an OCF with multiple cells were that it would provide one more level of protection against leaking, provide more precise monitoring capabilities, and be easier to remove soil in the future should an innovative treatment technology become available.

Although there may be situations where multiple cells are appropriate for hazardous waste landfills, EPA does not agree that multiple cells are warranted for the OCF for this Site for several reasons.⁵ First, the contaminated soil and debris that will be disposed is contaminated only with metals rather than a mixture of metals and organic contaminants. Therefore, even though a wide range of metal concentrations found in soil, adverse reactions caused by different types of contaminants mixing together within the OCF are not likely to occur. Another reason adverse reactions are not expected is that contaminants leaching out of the soil are expected to decrease once the OCF is closed (i.e., when the contaminated soil and debris is isolated from surface and ground water).

⁵ The reasons that landfills are normally separated into multiple cells is to (1) separate incompatible wastes and the leachate from those wastes and (2) to limit the open portion of a large landfill that will operate over many years so as to limit the area available for collection of precipitation. Under this scenario, each cell would be constructed and covered prior to constructing another cell. Neither of these reasons are relevant to the Asarco OCF as the waste to be placed is not incompatible and the time the OCF will be open is short.

EPA does not agree that multiple cells would allow for more precise monitoring of down-gradient ground water. The reason is that wastes with the same contaminants would be disposed in each of the cells so in the event that leachate move through the OCF liners and reaches the ground

water it would be difficult to identify from which cell it came.

Operation and maintenance of several leachate collection and removal systems due to multiple cells would be more difficult than operating a single cell leachate collection and removal system. EPA does not believe that operating multiple leachate systems would significantly increase the effectiveness of the OCF. Finally, there do not appear to be any new promising treatment technologies on the horizon that would justify disposing soils with different levels of contamination in separate cells.

7.2.2 Soil Treatment Comments

Other commenters recommended that contaminated soil should be treated prior to disposing it in the OCF. The basis for this recommendation was to provide more protection should part of the OCF fail in the future and to be consistent with land disposal restrictions (LDR), which require treatment prior to disposal.

In response, EPA performed an analysis to determine whether treating soils prior to disposal in an OCF is necessary. EPA compared the potential for contaminants leaching from an OCF into underlying ground water if soils were not treated versus if some (15 percent) of the soils were treated. EPA used 15 percent to represent the percentage of soils that are most highly contaminated.

First, EPA assumed that the OCF had a "good" liner and a "good" cap, meaning that the liner and cap conformed to landfill performance requirements. EPA compared estimated leachate rates from this OCF if soils were not treated versus if 15 percent of soils were treated. In both cases, the predicted contaminant loading to ground water was minimal. Treatment did not provide a significant advantage in effectiveness.

Second, EPA assumed that the OCF had a "poor" cap and no liner. Again, EPA compared estimated leachate rates for no treatment versus 15 percent treatment. The predicted rate for no treatment was 106 grams of arsenic per day and the predicted rate for 15 percent treatment was 93 grams of arsenic per day. EPA concluded that this difference is not significant and that treatment did not provide an advantage in effectiveness (but the analysis does show that maintenance of the OCF's cap and liners is important). See Appendix D.

Based on this analysis, EPA believes that treating soils prior to disposal in a properly maintained OCF is not necessary.

In response to the LDR comment, EPA's policy is that waste that is consolidated within an area of contamination is not "placement" and therefore does not require compliance with LDRs (i.e., treatment prior to disposal).

After the Proposed Plan was issued, Asarco submitted its final treatability analysis. One conclusion was that treating soils results in a 30 to 60 percent increase in the volume of soil. The analysis also reported results of additional TCLP and water leaching tests conducted on the treated soil. The TCLP data taken 28 days after treatment, although well below regulatory levels, is slightly higher than data taken immediately after treatment. It is not certain whether this indicates that treatment would be less effective over time in immobilizing contaminants. However, favorable results were obtained from water leaching tests, another measure of the effectiveness of stabilization/solidification. Asarco's analysis is in the administrative record.

7.2.3 Shoreline Armoring Comments

Several commenters questioned whether the slag shoreline was eroding, whether the eroded slag particles caused an adverse impact on the adjacent marine environment, and why the shoreline needed to be armored as it is already providing a suitable habitat for marine biota. If shoreline armoring was determined to be necessary, commenters also questioned how it would be anchored to the existing slag face and why riprap (large rocks) was selected instead of artificial beach nourishment (small rocks and sand) to armor the slag.

The need for shoreline armoring is based on the visual observation that slag is eroding in several locations along shoreline and on a report published by Battelle (Crecelius 1986) that

showed that metals released from freshly exposed slag are toxic to marine organisms for up to three to four months. After evaluating the comments received, EPA still believes that some amount of shoreline armoring will be necessary. However, EPA has determined that before the design of the shoreline armoring begins additional data should be collected to determine (1) the extent of shoreline erosion; (2) how and where armoring should be placed; and (3) the impact of armoring to the existing marine biota versus the impact of not armoring slag to the marine biota over time.

After reviewing the most recent literature and discussing riprap versus artificial beach nourishment with the Corps of Engineers, EPA believes that the marine environment off-shore of the Asarco Site would not support artificial beach nourishment due to the high wave energy and fast currents in the area (See memo by ROY F. WESTON, Inc. in the Administrative Record, Section 2.4.1).

8.0 SUMMARY OF THE COMPARATIVE ANALYSIS OF ALTERNATIVES

EPA uses nine criteria to identify its preferred alternative for a given site or contaminant. With the exception of the no action alternative, all alternatives must meet the first two "threshold" criteria. EPA uses the next five criteria as "balancing" criteria for comparing alternatives and selecting a preferred alternative. After public comment, EPA may alter its preference on the basis of the last two 'modifying' criteria.

This section evaluates both the alternatives developed by Asarco (described in Section 7.0) and the remedy selected by EPA (described in Section 9.0) based on the nine criteria described in Table 8-1. The purpose of this evaluation is to highlight the most significant advantages and disadvantages of the alternatives in relation to each of the nine criteria (a more detailed evaluation is provided in Table 5-4-1 of Asarco's FS).

All nine criteria are important; but they are weighed differently in the decision-making process depending on whether they describe a required level of performance (threshold criteria), provide for consideration of technical or socioeconomic merits (balancing criteria), or involve the evaluation of non-EPA reviewers that may influence an EPA decision (modifying criteria). The modifying criteria are generally considered in altering an otherwise viable alternative.

The no-action and limited action alternatives, discussed in Section 7.0, are not protective of human health and the environment and thus are not further evaluated under the nine criteria. Neither alternative effectively addresses contaminants moving into the ground water even though human health may be somewhat protected through administrative or legal measures identified under "limited actions."

(1) Overall Protection of Human Health And The Environment

The key factor in evaluating the overall protection provided by each of the alternatives is the extent to which an individual's exposure to contaminated soil, slag or surface water is reduced or eliminated and the extent to which the contaminants moving into surface water and ground water are reduced or eliminated.

Plant Site Soils. Asphalt and multi-layer soil caps are protective because they reduce direct contact with contaminated soils and prevent wind-borne releases. Caps also reduce the migration of contaminants from soil to surface water or ground water by reducing surface water flowing through the soil. The more impermeable a cap is, the less surface water will penetrate the cap.

TABLE 3-1. EPA'S NINE EVALUATION CRITERIA

THRESHOLD CRITERIA

1. Overall protection of human health and the environment - How well does the alternative protect human health and the environment, both during and after construction?
2. Compliance with federal and state environmental standards - Does the alternative meet all ARARs and state and federal laws?

Alternatives that are not protective or do not attain ARARs are not evaluated further under the remaining criteria.

BALANCING CRITERIA

3. Long-term effectiveness and permanence - How well does the alternative protect human health and the environment after completion of cleanup? What, if any, risks will remain at the site?
4. Reduction toxicity, mobility, or volume through treatment - Does the alternative effectively treat the contamination to significantly reduce the toxicity, mobility, and volume of the hazardous substance?
5. Short-term effectiveness - Are there potential adverse effects to either human health or the environment during construction or implementation of the alternative? How fast does the alternative reach the cleanup goals?
6. Implementability - Is the alternative both technically and administratively feasible? Has the technology been used successfully on other similar sites?
7. Cost - What are the estimated costs of the alternative?

MODIFYING CRITERIA

8. State acceptance - What are the state's comments or concerns about the alternatives considered and about EPA's preferred alternative? Does the state support or oppose the preferred alternative?
9. Community acceptance - What are the community's comments or concerns about the preferred alternative? Does the community generally support or oppose the preferred alternative?

Soil excavation in source areas would significantly reduce migration of contaminants to ground water and would, therefore, be protective of off-shore sediments and sea life. Disposal of soils in an appropriate disposal facility, either on site or off site, would prevent direct contact to humans or animals and prevent releases to the environment in the future. Off-site disposal would be protective of ground water and nearby populations because it would permanently remove contaminated source area soils off the Site. An on-site disposal facility (OCF) in the parking lot area, on the plant slag, or in the arsenic kitchen area can be designed with the appropriate engineering measures and institutional controls to minimize or eliminate direct contact with the contaminated soils disposed in it. These measures will also reduce the potential for releases to the environment from the OCF. The OCF is a permanent disposal facility for soils and debris. Treatment of soils would also significantly reduce the potential for the release of chemicals into the environment.

Using the residential soils as a sub-base for a cap is protective because the soils would be placed under a low permeability clay layer and soil cap. The appropriate institutional controls would prevent disturbances of the cap. These soils have not been found to leach above regulatory levels.

In addition, these soils will be disposed on top of the non-source area soils and slag that are not located near ground water. Residential soils contain significantly lower concentrations of contaminants than the material they will be placed on. Therefore, disposing residential soils on site will not add to existing groundwater contamination.

Demolition. The conventional demolition techniques for dismantling buildings, the only alternative evaluated, will be performed in a manner that is protective by first cleaning the buildings and then using dust suppression measures during the demolition activities. Any water generated during the dust suppression activities will be collected to the maximum extent practicable to prevent release into the environment. The effectiveness of dust suppression activities will be evaluated with ambient air monitoring.

Surface Water. For surface water, the replacement of the existing drainage system is protective of the environment because contact between surface water and contaminated sediments in the pipes would be eliminated. Releases of contaminated surface water to ground water through leaks in the pipes would also be eliminated. Slip-lining or repairing the existing drainage system may achieve these benefits, however, the location of all of the existing pipes is not known and many of the existing pipes may not be large enough to be slip-lined. These reductions would result in lower discharges of contaminants to Commencement Bay. The diversion of surface water run-on away from contaminated soil would also control contact between surface water and contaminated soil.

Implementation of erosion controls and other best management practices during the cleanup would control contact between surface water and newly exposed contaminated soil and reduce the transport of contaminants to Commencement Bay. Treatment of surface water would permanently reduce contaminants currently discharged through outfalls to Commencement Bay, but unless the source(s) of contamination is removed, treatment time would be indefinite.

Ground Water. Although specific active groundwater cleanup activities (e.g., pump and treat) will not be conducted during this phase of cleanup, the contaminant loading to the ground water, and to Commencement Bay is expected to decrease significantly based on soil removal, capping of the soil and slag and replacing the surface water drainage system. The potential for exposure to humans will be significantly decreased by placing deed restrictions on the property to prevent the use of ground water.

Shoreline Armoring. Both shoreline armoring and artificial beach nourishment are protective because they control the erosion of the slag shoreline into Commencement Bay and will reduce contaminant leaching from freshly exposed slag faces.

All actions are protective except the no-action, monitoring, or limited action alternatives.

(2) Compliance With Federal And State Environmental Standards

ARARs for all of the alternatives are identified in Table B-8 in Appendix B of this ROD. The following discussion highlights the more important ARARs for this cleanup.

All alternatives will comply with ARARs except the monitoring of limited action alternatives.

Plant Site Soils And Debris. For soil, an important requirement is attaining the soil cleanup levels and complying with the requirements for selecting cleanup actions under the state's Model Toxics Control Act (MTCA).

Residential standards for soil cleanup will be attained through removal of soil from the source areas and capping the Site (see Figure 7-1 for diagram of soil cap). Institutional controls would ensure that the integrity of the cap is maintained. Construction and maintenance of a cap would allow for a variety of potential uses, including residential, recreational, and commercial uses. MTCA's requirement for selection of cleanup actions is discussed in Section 10.4 ("Utilization of Permanent Solutions and Alternative Treatment Technologies to the Maximum Extent Practicable").

Requirements for design, construction, and operation and maintenance of an OCF are set forth in federal and state law (see Section 9.9, performance standards for the OCF). Federal and state laws for hazardous/dangerous waste landfills include requirements for groundwater monitoring, closure and post-closure, and landfill design and construction.

Both EPA and the State of Washington have "Area of Contamination" policies that provide flexibility when consolidating hazardous or dangerous waste within the portion(s) of the Site that contain already-existing continuous contamination. For example, consolidation of soil and debris on site will not trigger requirements for treatment in order to comply with LDR.⁷

Under the Clean Water Act, mitigation measures must be conducted if capping or other cleanup measures will result in adverse impacts to wetlands or other natural resources.

⁶ A cap may not be necessary in some areas of the site if the contaminant levels remaining in the soil after excavation are below the action levels for the Ruston/North Tacoma residential cleanup (230 ppm arsenic, 500 ppm lead) or comparable levels for other contaminants as determined by EPA and Ecology. In such event, soil removal would be combined with adoption of appropriate components of the community protection measures program being used in Ruston/North Tacoma.

⁷ The Proposed Plan referenced the Corrective Action Management Unit (CAMU) rule. Because treatment has not been selected for the cleanup, the CAMU rule is not an ARAR.

Demolition. The buildings remaining on site will be demolished as part of this cleanup. Requirements that were used during the previous demolition phase will be applicable to the remaining demolition (see EPA's ROD dated December 31, 1990). These requirements include testing of debris to determine whether it is a hazardous or dangerous waste and, if so, handling, storage, and disposal of such waste in accordance with federal and state standards. Temporary on-site storage of hazardous waste (e.g., materials removed from the fine ore bins building or source area soils that are excavated while the OCF is under construction) will comply with requirements for waste piles.

Surface Water. Best management practices (BMP) will be used during soil excavation to reduce contact between surface water and newly exposed contaminated soils. Examples of BMPs include sediment ponds, silt fences, diversion ditches, and cut and fill slopes.

The objective of surface water cleanup is to attain requirements for stormwater discharges and surface water cleanup standards under MTCA (see Section 9.9 for surface water performance standards). It may be necessary to establish a mixing zone to attain the discharge limitations for surface water from the point source discharges at the Site (the three surface water outfalls). A mixing zone measures compliance at a location in the surface water near, rather than at, the point of discharge and is authorized under WAC 173-201A-100. Whether a mixing zone is appropriate and, if so, the parameters of a mixing zone, will be determined during remedial design.

Ground Water. EPA will implement a two-step approach with respect to restoring ground water. The first step is removing the contaminated soils that are the sources of contamination in ground water and continued monitoring to determine the impacts of source control on groundwater

quality. The second step would include further active measures to cleanup ground water, if necessary and as feasible, to attain the required groundwater cleanup levels under MTCA.

The source control measures in the first step are in effect an interim action with respect to ground water. Because it is not certain that source control measures alone will restore groundwater quality to required levels under MTCA, EPA is using the interim measures waiver for groundwater ARARs. This means that attainment of the ground-water cleanup levels is deferred until the effectiveness of source control can be evaluated. EPA's preliminary remediation goals for ground water (see Section 9.9) will be used as benchmarks for this evaluation.

In the interim, EPA will require Asarco to implement institutional controls (deed restrictions) to ensure that ground water at the Site is not used for drinking water.

Shoreline Armoring. Under the Clean Water Act, mitigation measures must be conducted if armoring will result in adverse impacts to intertidal habitat.

(3) Long-Term Effectiveness And Permanence

Plant Site Soils. The alternatives that excavate contaminated soils in source areas would be more effective over the long-term in restoring ground water and surface water quality and preventing direct contact and ingestion than alternatives that leave such soils in place, even if capped. Permanently removing the primary sources of contamination is a key factor in cleaning up ground water and surface water.

The most widely discussed issue for this cleanup has been how to dispose the contaminated soil that is excavated from the source areas. The alternatives range from disposing the soils in an OCF, treating the soils by solidifying them using a cement and lime matrix and using the treated soil as sub-base for a site cap, treating such soils and disposing them in an on-site solid waste landfill, or transporting the soils to be disposed in an off-site hazardous waste landfill.

The following paragraphs discuss the effectiveness of each of these alternatives over time.

Plant Site Soils - Treatment. An effective treatment method for the metal-contaminated soils at the Asarco smelter is solidification/stabilization. This method does not destroy or detoxify the contaminants in the soil but rather binds the contaminated soil with lime and cement to create a concrete matrix. The contaminants are less able to migrate through the soils into other media, for example, ground water, surface water, or air.

Asarco has performed pilot tests on nearly 500 cubic yards of contaminated soil from source areas at the smelter. The results, some of which were received after the Proposed Plan was issued (see Appendix C for a summary of the report), generally show that treatment will effectively bind the contaminants for a long time. The potential for contaminants to migrate into the ground water or surface water if the treated soil comes into contact with water is expected to be minimal, if the concrete matrix remains stable.

This method of treatment, however, has been used on contaminated soils at other Sites only in the last several years. Therefore, it has not yet been proven that actual results of solidification over many years will match the predicted results from pilot tests. Also, TCLP leaching results taken 28 days after soil treatment show a slight increase compared to TCLP results taken immediately after treatment. Although both sets of results are below hazardous waste levels, it is not certain whether this is indicative of a long-term trend towards increased leaching.

In addition, there are other long-term concerns with selecting treatment at this Site. Many of these concerns relate to the compatibility of cleanup with future uses of the Site. It should be noted that Asarco's land use plans were based on an OCF. Disposing treated soil on site is not necessarily compatible with these plans for the reasons noted below. These "disadvantages" compared to disposal in an OCF arise because land use plans based on treatment were not developed. Current land use proposals do not discuss whether the development "disadvantages" of disposing treated soils on site can be made compatible with land use plans.

The primary concern is that mixing in the treatment additives increases the volume of the

contaminated soil approximately 30 to 60 percent. It is not certain that treated soil can be compacted to significantly reduce the increased volume. Because it is important that the concrete matrix remain relatively undisturbed and because the treated soil may not be stable enough to support buildings above it, disposing of an increased volume of material on site may impact plans for future construction on the property. Treated soil would have to be disposed only in areas where no construction is likely to occur.

It would also be necessary to monitor the Site to verify the continued effectiveness of treatment. Because sampling treated soil through a site cap is not recommended (punching holes through a low permeability cap is not a good practice), EPA most likely would require continued monitoring of ground water to detect whether concentrations of contaminants in ground water are increasing as a result of metals leaching out of the treated soil. If treated soil is widely dispersed on-site and problems in ground water are detected, it may be difficult to determine which specific areas of treated soil are responsible, thus making it harder to correct the problem. Disposal of treated soil in a solid waste landfill would eliminate many of the problems associated with future Site development and monitoring of the treated soils beneath a site cap.

Another concern is that the effectiveness of treatment was not demonstrated on oversize material (greater than 2 inches in diameter) such as gravel, cobbles, bricks, wood, concrete and other masonry and building debris. Whether a modified process, which could include crushing the oversize material into smaller pieces, would be effective is not known. Accordingly, it is possible that even if treatment was selected, there may still be a significant volume of oversize materials from the Asarco Site that would need to be disposed in another manner.

The last concern is that because concentrations of contaminants are not reduced, it would still be necessary to cover the treated soil with a cap. The cap would need to be inspected and maintained on a regular basis in order to ensure that people do not come into contact with the treated soil in the future. Earthquakes or landslides that affect the cap would need to be responded to in order to prevent contact with the treated soil. It should be noted, however, that because contaminated soil and slag outside the source areas will remain at the Site, a cap over the entire Site will be necessary, and will require inspections, regardless of whether treatment is used.

Plant Site Soils - Disposal in an OCF. This option calls for disposal of contaminated soil and debris in a landfill that would be constructed on site known as the OCF. The design, construction and operation of the OCF would conform to requirements for hazardous waste landfills. Three important issues are discussed in this section regarding an OCF: what type of structure will be built, how that structure will be maintained, and where it will be located on the Site.

The purpose of the OCF is to isolate the contaminated source area soils and debris in a confined area so that contaminants do not migrate into the environment. The OCF will be composed of multiple layers of clean soil and clay that are several feet thick with synthetic liners above, below and around the contaminated soil. These multiple layers serve two primary purposes: to prevent rainwater and ground water from moving into the OCF (water coming into contact with contaminated soil and debris increases the movement of contaminants) and to collect, remove and dispose of any liquids from inside the OCF. As long as these multiple layers are designed, constructed and maintained properly, the OCF will be effective over the long-term in isolating the contaminated materials. Proper design and construction of the OCF will include safeguards to prevent or minimize damages resulting from earthquakes or landslides to the maximum extent practicable.

In addition to the multiple layers of the OCF acting as a barrier to groundwater infiltration, a groundwater diversion system will be constructed in order to re-route ground water away from the OCF.

The primary disadvantage of the OCF option is that the soil and debris will not be treated and will continue to contain high concentrations of contaminants. If there is a breach of the OCF structure, the soil and debris could pose a threat to human health and the environment. Two examples of structural concerns are the finite life of the synthetic liners that will be part of the OCF structure and the potential for the cover to fail. See Section 7.2 above for discussion of EPA's analysis of whether to treat soils prior to disposal in an OCF.

In order to address these concerns, a consistent and reliable operation and maintenance (O&M) program is necessary to ensure the continued effectiveness of an OCF. Important components of the O&M program would include a leak detection system and collection and removal of leachate. The clay portion of the liner should have an indefinite life. One objective in designing the OCF will be to provide as much access as practicable to the wells and cover of the OCF for maintenance and repair.

Maintaining the effectiveness of the cover is also important. Water and wind erosion, lack of vegetation, excessive sunlight, and disturbance by animals or people are all potential problems for landfill covers. Methods to address these potential problems include burying the cover below many feet of soil, ensuring that surface water drains properly over the top of the structure, diverting ground water away from the structure, and maintaining healthy vegetation over the cap to minimize soil erosion.

A program to monitor ground water downgradient from an OCF would be required to ensure that contaminants are not moving out of the structure and into the environment. One potential advantage of the OCF over treatment is that, because the wastes will be confined to a specific area of the Site, it would be easier to monitor downgradient ground water and perhaps to identify and correct problems.

Different kinds of designs for an OCF or landfill were evaluated in the FS, such as linear/concrete cells, circular tanks, and circular bermed structures. The circular earth berm is most like a conventional landfill and it can more readily comply with the requirements for hazardous or solid waste landfills than the linear or concrete tank alternatives.

The vertical walls that are part of the linear, concrete cells would be more difficult to design and construct to meet containment requirements. Another disadvantage is that it would be more difficult to divert ground water below and around a linear system than it would be for the circular systems.

Another important issue with respect to long-term effectiveness for an OCF is its location at the Site. All of the proposed locations for an OCF would be protective of the local community and the surrounding environment. The parking lot is the closest location at the Site to existing residences. The arsenic kitchen and plant slag areas are considerably further removed from residential areas. The depth to ground water in the parking lot ranges from 40 to 90 feet, compared to approximately 6 feet in the arsenic kitchen and approximately 10 feet in the slag fill.

The arsenic kitchen area was selected as the location of the OCF because that location is most compatible with future land use plans. Because ground water is relatively shallow in the arsenic kitchen area, however, an OCF in this location would have to be well-engineered and maintained in order to be protective of ground water. "Well-engineered and maintained" refers to the liners, leachate collection and removal systems, cover, diversion system, and other components described above. For example, well-maintained impermeable and drainage layers would need to be part of the bottom liner in order to be protective of ground water.⁸

⁸ The bottom liner will be a double liner system. The first liner collects leachate (water that passes through the waste and is contaminated). The leachate is pumped from a trench and treated and/or removed. The second liner is below the first and collects any leachate that may have passed through the first liner.

Plant Site Soils - Off-Site Disposal Options. Another disposal alternative is transport and disposal of soil and debris in an off-site hazardous waste landfill. This would eliminate the problems described above associated with managing such waste on site. It should be recognized that slag and contaminated soil in non-source areas would remain on-site and still would have to be addressed by capping.

Plant Site Soils - Capping. The above paragraphs discussed management of soils that are significant sources of contamination to ground water. Soil and slag in other areas are believed to have a lower potential for contaminants to migrate into ground water, however, these areas still have elevated levels of chemicals for which a cleanup action is necessary. Leaving such soils in place and placing a multi-layer soil cap on top of them to reduce surface water infiltration will be the most effective in protecting surface water and ground water over the

long-term. Further, the soil cap will reduce leaching in the Southeast Plant area, which is impracticable to excavate (see Section 8.6 below).

Either a soil or asphalt cap would be effective in: eliminating the risk of direct contact with or ingestion of contaminated soils and slag; preventing erosion of contaminated soil or fine grain particles of slag into Commencement Bay; reducing the extent to which surface water comes into contact with contaminants in soil and transports them directly or via ground water to Commencement Bay; and preventing the pooling of contaminated water on site. In order for either type of cap to be effective over the long-term, inspections, maintenance, and restrictions on digging below the cap would be necessary. An asphalt cap will require more inspections and maintenance than a soil cap to prevent, detect, and repair cracks and other defects.

An effective long-term solution for disposal of soil from the Ruston/North Tacoma residential cleanup is to use such soil as sub-base for the smelter site cap on top of slag. The site cap would prevent direct contact with the residential soil and reduce surface water coming into contact with the soil. A soil sub-base still would be required on the Site even if Ruston/North Tacoma residential soils were not used.

Demolition. Several buildings remain on site, such as the fine ore bins building, which is used for storage of contaminated materials, the administration building, the surface water evaporation system, and the transformer buildings. The demolition of remaining structures and disposal of the debris will remove the potential for contact with contamination in the buildings and structures. Disposal of materials stored in the fine ore bins building in the OCF (hazardous waste demolition debris, contaminated ERA soils, and calcine deposits) will eliminate the threat that contamination from the demolition debris and the calcine deposits will migrate into the environment. Materials in the fine ore bins building are suspected of contributing to groundwater contamination.

Surface Water. For cleanup of surface water, plugging and abandoning the existing drainage system and replacing it with a new surface water drainage system is the most effective approach over the long term. This alternative will eliminate releases of soil and water from the existing system into ground water and eliminate contact between surface water and contaminated sediments in the pipes.

It would be less effective to attempt to repair leaks and to clean out contaminated sediments because the location of all existing pipes is not certain. Inserting slip lines into pipes with cracks would also be somewhat effective but could not be done in all pipes due to the small diameter and deteriorating condition of some of the existing pipes. Some pipes may need to be replaced even if sliplining were selected as the remedy.

Rerouting surface water that runs onto the Site, from Ruston for example, would reduce contact with contaminated Site soil but would not affect surface water on the Site itself, i.e., rainfall. A new or repaired on-site drainage system would still be necessary.

EPA evaluated treating surface water before it discharges into Commencement Bay even before contaminated soil from the source areas is excavated. Removing the source areas is a necessary first step in any cleanup scenario. Unless the source areas are removed, treatment of surface water could be required indefinitely. Although treatment of contaminated surface water is potentially effective, it may be difficult to consistently achieve cleanup levels given the volumes of water requiring treatment, estimated to be up to 900 gallons per minute. Also, treatment of all surface water may not be possible during significant rainfalls. Bypass flow could be necessary, during such events.

Because the cleanup includes source removal, a new drainage system, and a site cap, it is likely that remaining contaminated surface water, if any, would be from off-site areas. One objective of the new drainage system would be to avoid recontamination of the site cap by surface water run-on. Also, if surface water run-on from off-site areas is contaminated, this problem may need to be addressed in the future.

Ground Water. It is anticipated that groundwater contamination will decrease over the long term because the most significant sources of the contamination will be removed and the entire site will be capped. One purpose of the site cap is to reduce surface water flow into the remaining

on-site contamination soils, which should further reduce the movement of contaminants from soil into ground water.

Shoreline Armoring. The use of large rocks or boulders to armor the shoreline has a better potential to withstand current and wave action and remain in place compared to using the smaller pebbles described in the artificial beach nourishment alternative. If artificial beach nourishment were used, it would be necessary to include measures such as stone face dikes or breakwaters to decrease the effects of the currents and wave energy to prevent extensive erosion of small rocks and sand. If small rocks and sand had to be replaced frequently, recolonization of marine life would be difficult.

In addition, neither riprap nor beach nourishment are typically placed on slopes as steep as those found at this Site; a cutback would be required for either alternative. Areas that are steeper than 1 (horizontal) to 1.5 (vertical) will need a cut back. The toe of the riprap would need to be constructed 1.5 to 2 times the wave height below the water line. Established construction techniques would be used to anchor the toe and face of the armoring. Although stone faced dikes, breakwaters and revetments are commonly constructed, it is uncertain whether it will be possible to place these types of structures at the Asarco Site.

(4) Reduction of Toxicity, Mobility, Or Volume Through Treatment

Plant Site Soils and Surface Water. Soil treatment by solidification/stabilization of source area soils ranks the highest for this criterion. The mobility of contaminants in the soil would be significantly decreased by binding them up in a cement matrix. However, the toxicity of the contaminants would not be decreased and the volume of soil would increase by approximately 30-60 percent. Soil excavation and disposal in an OCF does not satisfy this requirement.

Treatment of surface water is the only surface water alternative that would reduce the mobility, toxicity, and volume of contaminants. Disposal of contaminated sludges from the surface water treatment process would be necessary.

(5) Short-Term Effectiveness

Plant Site Soils. All alternatives involving soil excavation would result in dust emissions, surface soil erosion, noise and truck traffic. Air monitoring, dust control measures (for example, wetting the soil prior to excavation) and using established transportation routes would be required to mitigate these affects. Also best management practices would be used to control surface water coming into contact with newly exposed contaminated soil. Other traffic control measures could be implemented, such as cleaning truck wheels and lining and covering truck beds when transporting contaminated materials on public roads.

Health and safety procedures would be required under all of the alternatives for workers involved with the handling of contaminated soil.

The construction of any of the alternatives for landfills would result in the short-term release of dust, increased impact of trucks and excavation equipment on site and on public roadways surrounding the site. Safety and dust controls measures would be implemented.

The primary potential short-term risk of off-site disposal is from the large number of trucks hauling material off the site. All transportation and safety requirements would be required.

Capping the soil in place with an asphalt or soil cap would pose limited short-term risks from heavy equipment movement and dust generated from grading the Site. Asphalt capping would take approximately 3 months if Ruston/North Tacoma residential soils are not used as sub-base. If all of the Ruston/North Tacoma residential soils are used as a sub-base, soil capping would take approximately 7 to 8 years. If all residential soils are not disposed, on the site, soil capping and regrading could be completed within 12 months. Residential soil that is excavated after the cap is in place would be disposed in an appropriate off-site facility pursuant to EPA's ROD and Ecology's Dangerous Waste exemption for Ruston/North Tacoma.

The stabilization treatment system would be fully enclosed thus preventing releases of contaminants into the air and would, therefore, cause the least short-term risk. The system used during the pilot-scale study effectively controlled releases and similar measures are

feasible for a full scale project.

Demolition. The alternatives for demolishing and dismantling buildings will be effective in safely removing the existing structures. However, short-term releases of dust and particulates will result from these activities and will need to be effectively controlled. Demolition will include dust suppression measures to minimize dust emissions to ambient air and to protect workers. Air monitoring devices will also be used to determine whether air emissions exceed the standards used during previous demolition activities; if so, demolition activities will be temporarily discontinued or additional measures to reduce emissions will be undertaken as appropriate. Demolition of all remaining buildings would take 6 months, but are not likely to begin until 1996.

Surface Water. With respect to altering the existing drainage system, maintenance of the existing system would cause the least short-term risk since little, if any, soil would be disturbed. Slip lining the existing pipes would present some risks to the workers associated with routine plant site action but no adverse effects are expected in the general community. This alternative may present the most risk to the environment if sediments within the drainage pipes were pushed out of the pipes while inserting the liners. Diversion of off-site surface water run-on would present additional short-term construction risks and risks to the community since implementation of this activity would take place off of the smelter property. Plans to prevent traffic and road construction hazards would be necessary.

Completely replacing the drainage system could cause dust to be temporarily generated since some soil excavation and construction will be necessary. This would present short-term risks to site workers and the near-by residents. If the new drainage system were completely constructed within the clean soil of the cap, some of this risk (i.e., posed by contaminated soil) would be eliminated. Many of the original drainage pipes can be sealed and grouted, although, removal of some of these pipes may be necessary. In this case, some soil and/or slag excavation may be necessary. A new surface water drainage system would be installed at the same time the soil cap is being put in place, so sequencing these activities with respect to trucks and workers would be important.

All of these drainage system cleanup approaches would take 2-3 months to implement. The entire system would need to coincide with placing the cap; the other surface water alternatives would occur before the cap placement.

Surface water treatment also poses short-term risk because it would include the construction of a new surface water treatment facility and installation of a new drainage system. Even though transportation routes and operating hours can be established, more noise and truck traffic would be expected. Constructing a surface water treatment plant would take 9 months from ground breaking; it would likely be operated forever if source control measures are not also taken.

Ground Water. In the short-term, metal concentrations in ground water are expected to increase due to the dust-suppression measures (water to control dust enters the soil and moves into underlying ground water) and to the disturbance of contaminated soil within the aquifer. Generally, these higher levels are expected to decrease within a year. Regular long-term monitoring began in the spring 1994, so baseline groundwater data can be used as a reference to determine if elevated levels are temporary or if additional cleanup measures are necessary. Due to groundwater diversion measures, the volume of ground water moving through the Site may be significantly decreased; thereby temporarily increasing the concentration of contaminants because less dilution would occur.

Shoreline Armoring. Placing larger rocks (riprap) as armoring along the shoreline may result in the temporary suspension of finer-grained sediments. Temporary release of metals from newly fractured slag particles in Commencement Bay also may occur if it is necessary to cut back the angle of the shoreline in order to place the riprap. In addition, armoring with riprap would significantly impair or destroy much of the intertidal marine biota that currently exists on or along the shoreline. But riprap can be designed and constructed so that intertidal biota would recolonize this area. Placing riprap would take approximately 12 months.

Mitigation measures, such as replacing valuable habitat, will be required to replace or augment any damage incurred with armoring. The extent of replacement or augmentation is not currently known; it is estimated that this could take up to two years. In order to mitigate damage caused

by armoring, the creation of pocket beaches, mudflats and vegetated shallows will be evaluated. Sloping and/or cutbacks may be used and shoreline irregularity can be designed to support future mitigation of the marine biota. Mitigation may occur at the Asarco Site or another location off the Asarco property.

(6) Implementability

Treatment of source area soils using a solidification/stabilization method is implementable. With the exception of the following practical limitations, excavation of source area soils is implementable. Some of the practical limitations on excavating soil from the source areas include:

- (a) Natural features. In the arsenic kitchen area soil excavation will be limited due to the presence of a silt aquitard that is beneath the soils. The aquitard acts as a natural protective barrier preventing metals from moving into the deepest groundwater aquifer on the site. EPA believes that it would be detrimental to the lower aquifer to excavate some or all of this protective silt barrier even though the upper portions of it may contain metals with elevated concentrations of contaminants.
- (b) Man-made features. It is estimated that 15 million tons, or approximately 40 acres, of slag make up the plant area and the slag peninsula. Previous plant site investigations show that slag contains up to 25,000 parts per million arsenic, copper and lead. Excavation of all of this slag is not practicable, however, because of its large volume, the potential for fractured slag to reach the bay during excavation, and the cost to dispose this volume of material.

The copper refinery and the fine ore bins areas include both contaminated soil and slag. If, after soil removal, these areas continue to act as significant sources of groundwater contamination, EPA will evaluate whether further excavation of slag is necessary.

In the southeast plant area, the combination of organic constituents such as DMA and buried sawdust appear to enhance the mobility of metals in slag, resulting in high concentrations of metals in ground water. The sawdust, however, is buried 25 to 30 feet in slag and under saturated, highly permeable conditions adjacent to the shoreline. Excavation through the slag to remove the sawdust at these depths is not technically practicable.

Otherwise, soils in the arsenic kitchen, stack hill, cooling pond, copper refinery and fine ore bins area can be removed with conventional excavation techniques. Diversion trenches and other techniques to dewater source area soils prior to excavation would need to be used and are implementable when carefully designed and constructed. Treatment or disposal of contaminated water resulting from dewatering is implementable.

OCF

An OCF can be built in either the parking lot or arsenic kitchen areas of the Site. One concern regarding implementability is whether the OCF will have sufficient capacity for on-site soils and debris. Adding some capacity to the bermed structure in the parking lot and to the circular earth berm in the arsenic kitchen area prior to completion of the structure may be possible by increasing its height. However, the ability to "add" height is limited by the need for structural stability and by future uses of the Site. Capacity could also be added to the linear design. Capacity could not be added once the circular concrete tank is constructed.

Off-site disposal would probably require the construction of a staging area. Currently there is no railroad access to the site and trucks would have to be used to transport excavated soils and demolition debris to the staging area.

Capping the Site

Capping with either low permeability asphalt or soil is possible. For either type of cap it would be necessary to regrade the site and assure that several drainage and ponding areas on the site are eliminated. In general, capping would use common conventional construction techniques that have been proven reliable. Maintenance would be required for both types of caps but would be more intensive for the asphalt cap and would require annual crack sealing and seal coats.

Both caps would require guidelines to minimize overall disturbances after they are installed.

Portions of either type of cap would need to be removed if future cleanup activities are necessary (e.g., installing a ground-water pump and treat system).

Surface Water. Repair or replacement of the existing surface water drainage system is feasible but must be coordinated with soil excavation and capping activities. Conducting repair/replacement activities prior to placing the cap would not be difficult to implement. Once a cap is in place, maintenance, repair or replacement of the existing drainage system or the slip-lined system would be the most difficult since it would require breaking through the cap.

Sliplining most pipes in the current drainage system is technically feasible for most, but not all, of the drain pipes. Also, in order to find and access some of the drainage pipes for slip-lining, it may be necessary to excavate some of the slag. In general, slag excavation is more difficult than removing soil and newly fractured pieces of slag tend to be more leachable in surface and ground water. Over the long-term, it would be most practicable to build a new drainage system for several reasons: (1) blueprints of the new system would be available to future workers, owners, etc.; (2) a new drainage system can be constructed within the cap thus workers would not be exposed to contaminated soils beneath the cap when making repairs; and (3) the protective clay layer of the cap would probably not need to be breached if repairs or replacement of new drainage pipes are necessary. Property access from adjacent land owners for installation of some parts of a new system would be necessary.

Diversion of surface water run-on is also technically feasible. Property access for installation of the surface water diversion system from adjacent land-owners, the Town of Ruston and the City of Tacoma would be necessary and is believed possible. In addition, the City would have to verify that there was sufficient capacity at the City and/or Edwards Street outfalls to accept the diverted surface water.

Demolition. Building demolition and dust suppression are technically and administratively implementable because they employ conventional trade methods.

Ground Water. Groundwater monitoring is possible and has been conducted on this Site for many years. Bi-annual monitoring is currently being performed. Quarterly monitoring would begin as soon as soil excavation is complete and before a cap is installed.

Shoreline Armoring. See discussion above under "long-term effectiveness and permanence."

(7) Cost

EPA has grouped Asarco's cost estimates into two major categories. The first group contains these elements of the cleanup that EPA believes are essential under any acceptable cleanup alternative. The total cost of these "essential elements" is \$22.5 million. The estimated costs of essential elements and the disposal alternatives are shown in Table 8-2.

(8) State Acceptance

The State of Washington concurs with the selected remedy and phased approach described in this ROD for the former Asarco Tacoma Smelter Facility. The combination of measures to excavate and consolidate the more highly contaminated soils and debris in a containment facility with a design equivalent to federal hazardous waste disposal standards, to cap the entire Site, and to provide certain Site restrictions is appropriate and protective against exposure to such soils. This current ROD provides for measures to divert surface waters from contact with contaminants, however, the, ROD also provides that additional remedial measures may be taken on surface water should such further measures be necessary. Ground water will be addressed in a separate, second phase ROD which will be prepared after the impacts of the soils actions and water diversion measures under this ROD have been evaluated. This approach and selected remedy are deemed to be in compliance with the environmental laws and regulations of the State.

(9) Community Acceptance

EPA held a 90-day public comment period on the cleanup activities for the Site. It received approximately 900 comments either directly, or through Asarco or the Tacoma City Club. In

addition, EPA has considered public comments in developing its selected remedy by tracking the land use planning strategy and through contacts with and input from the public. Much of the public interest appears to be focused on what to do with the Asarco Site after the cleanup, however, there were many specific comments on the elements of EPA's Preferred Alternative.

EPA believes that its selected remedy will be acceptable to the community based on the public comment received and their continued involvement in implementation of this cleanup.

To date, the most debated public issue regarding the cleanup itself has been whether to dispose contaminated soil and other materials in an OCF. Many members of the community, including the elected leaders and local business leaders, expressed support for an OCF. It appears that most of the support for on-site disposal was a result of Asarco's promise, in the "Agreement in Principle," with Ruston, Tacoma, and the Park District, to fund an estimated \$15-20 million of future development activities on the Site.

Although the OCF provision in the Agreement in Principle is not binding on EPA, the overwhelming community support for an OCF is a significant factor in EPA's final remedy selection. Several commenters who generally supported an OCF suggested design modifications for the disposal facility such as treating soil before disposal, constructing separate cells within the unit for more precise monitoring and segregated disposal of soil (see Section 7.2 for EPA's responses to these comments). In addition, several commenters encouraged EPA to select the remedy that would be the most protective of human health and the environment over the long-term and not be influenced by Asarco's promise of future development. Based on EPA's belief that an OCF can be designed to be protective over the long-term and the overwhelming community support, EPA has significantly modified this component of its Preferred Alternative and selected disposal in an OCF rather than treatment.

EPA has received other significant comments on its proposed approach to cleanup the Site. Several natural resource trustee agencies and environmental groups have actively participated in EPA's technical meetings on cleanup and have submitted written comments. They have stated that EPA needs to develop an environmentally sound cleanup for the Site that ends current chemical contamination and that is not compromised or undermined by potential future land uses. EPA believes that its cleanup meets those objectives and that it will be important for these groups and local citizens to continue to be involved with the review of the remedial design plans for this Site.

In addition, the Department of Natural Resources, the U.S. Fish and Wildlife Department, Citizens for a Healthy Bay and Asarco raised questions regarding the need for armoring the slag based on the amount of slag erosion and the design of shoreline armoring. Although it is visually apparent that slag is eroding, EPA agrees with the commenters that the extent and location of erosion should be determined first (e.g., using durability tests). After this step, EPA has determined that additional design studies will be conducted to determine the location and extent of armoring, including cutbacks or excavation in order to anchor the base of the armoring.

EPA also received many comments that encouraged site cleanup to progress as quickly as possible. Therefore, EPA has decided that if the Site is ready to be capped, but all of the Ruston/North Tacoma residential soils have not been removed from the Study Area, the Site will be capped and an appropriate off-site disposal facility will be selected for these soils as per Ecology's dangerous waste exemption.

TABLE 8-2. COST

Essential Elements:

Activity	Capital Cost	Operation & Maintenance (annual)	Present Worth
Plant Site Soils:			
Capping the Site			
Smelter	\$6.4 m	\$6,000	\$6.5 m
Slag			
Peninsula	\$923,000	\$5,800	\$1 m
Demolish fine ore bins building			
	\$1.4 m	\$0	\$1.4 m
Interception trenches (for dewatering and diverting ground water)			
	\$710,000	\$0	\$710,000
Surface Water:			
Replace drainage system with new drainage system

(d) Excavation and treatment of soil and disposal of treated soil and debris in on-site hazardous waste landfill

	\$65.3 m	\$12,000	\$65.5 m
--	----------	----------	----------

Or

Other Elements:		(e) Excavation and treatment of soil and disposal of treated soil in on-site solid waste landfill, debris in off-site hazardous waste landfill
Institutional controls		
\$500,000	\$0	\$500,000
		\$70 m
		\$12,000
		\$70.2 m
Essential Elements Total	\$22.5 m	Or

(f) Excavation, and off-site treatment and disposal of soil and debris
\$75.1 m..... \$0
\$75.1 m

Essential Elements		Excavation/Treatment/Disposal		TOTAL Cleanup Costs
\$22.5 million		(a) plus (b) \$50.9 million		\$73.4 million
\$22.5 million		(c) \$22.8 million		\$45.3 million
\$22.5 million	+	(d) \$65.5 million	=	\$88 million
\$22.5 million		(e) \$70.2 million		\$92.7 million
\$22.5 million		(f) \$75.1 million		\$97.6 million

*This amount includes an estimated cost of \$200,000 to fill the tunnel. Removing the tunnel is estimated to cost \$2.2 million. The decision whether to remove or fill will be made during remedial design.

EPA's selected remedy combines elements from several of the media-specific alternatives described above. The selected remedy meets the requirements of the two mandatory threshold criteria, protection of human health and the environment and compliance with ARARs, and provides the best balance of benefits and trade-offs for the former Asarco Tacoma Smelter site.

Several proposed actions described in EPA's Preferred Alternative have either been initiated or completed since the public comment period. Ground water and sediments monitoring is underway (October 1994). In addition, EPA has allowed Asarco to abandon the production well (December 1994).

The following are the individual components of EPA's Selected Remedy.

9.1 PLANT SITE SOILS

9.1.1 Excavate Soil and Granular Slag From Five Source Areas 9

Contaminated soil that fails the TCLP test in the stack hill, cooling pond and arsenic kitchen areas and contaminated soil and granular slag from the copper refinery and fine ore bins building areas will be excavated to the extent feasible. The party (EPA or Asarco) conducting the cleanup will perform the following activities during soil excavation:

- (a) Asarco will submit the additional soil borings data required under the AOC (October 1994) to EPA during remedial design.
- (b) Use interception trenches, or other applicable technology, to divert ground water where necessary to allow for easier excavation of soils.
- (c) Control soil erosion and contaminated stormwater runoff by using best management practices (for example, sediment ponds, silt fences, diversion ditches, cut and fill slopes).
- (d) Confirm that all necessary excavation has been performed.
- (e) Remove or fill the car tunnel to allow for future land use plans. Whether the railroad tunnel will remain will be determined after discussions with Burlington Northern railroad.
- (f) Conduct a wetlands assessment at the Site.
- (g) Use capping material (see Section 9.1.3) to fill and regrade the excavated areas.

9 Excavation of the sixth source area, the southeast plant area, is impracticable (see "Implementability" in Section 8.0 above.)

9.1.2 On-Site Disposal

- (a) Construct an OCF northeast of the arsenic kitchen area. The OCF will be an approximately 600-foot diameter circular earth berm with an estimated capacity of 240,000 cubic yards. The liner, cap, leak detection, collection and removal system, leachate collection and removal system and surface run-on and run-off system will meet federal and state standards for a hazardous waste landfill, see performance standards in Section 9.9.
- (b) Construct surface water and groundwater diversion controls (for example, interception trenches and grout wall) around the OCF to prevent surface water and ground water from coming into contact with the OCF.
- (c) Dispose the soils excavated from the source areas, the bricks temporarily stored on the stack hill, and the hazardous waste materials temporarily stored in the fine ore bins building in the OCF. Materials that are not on-site as of the date of this ROD will not be disposed in the OCF.

- (d) ~~Crush or shred over-sized debris prior to disposal.~~
- (e) Conduct the appropriate seismic studies in order to construct the OCF to withstand earthquakes and landslides to the extent practicable.
- (f) Monitor air quality to ensure that dust is not generated when soil and debris are excavated and disposed in the OCF (see other "safety measures" below).
- (g) Do not dispose wet materials, including marine sediments, in the OCF.
- (h) In the design plans for the OCF, allow for a limited amount of additional capacity in the event more than the estimated 160,000 cubic yards of soil or 80,000 cubic yards of demolition debris require disposal. In the event the amount of waste to be disposed is greater than the maximum capacity of the OCF, this material will be disposed off-site in an appropriate facility.
 - (i) Develop a plan for the closure of Ruston Way adjacent to the Site when construction of the OCF occurs.
 - (j) Maintain the OCF in perpetuity.

9.1.3 Capping the Site (PSS and slag and the slag peninsula)

After excavation of materials from the source areas, cap the entire Site (with the exception of the OCF and the possible exception of the Stack Hill area, see performance standards below) with, from bottom to top, soil excavated during the residential Study Area cleanup, a low permeability clay liner, a gravel drainage layer, at least 12 inches of clean topsoil (i.e., below MTCA residential cleanup levels), and sod, see Figure 7-1. The cap will meet the performance standards identified in Section 9.9. Capping of the Site includes the following elements:

- (a) Grade and prepare the Site for capping, including grading the ramp constructed from Thorne Road slag. Use contaminated residential soils as a sub-base for the cap only in areas of the Site where they will not come into contact with ground water, for example, the slag portions of the Site. Stockpile contaminated residential soils on-site until they are ready to be used for capping.
- (b) If the Site is ready to be capped, but not all of the residential soils have been excavated from the Ruston/North Tacoma Study Area, an appropriate off-site disposal facility (see Ecology's dangerous waste exemption dated December 20, 1993) will be selected. Whether a temporary staging area, on- or off-site, will be necessary will be determined during remedial design.
- (c) Assure that existing asphalt and building pads on the site will not cause pooling and standing water beneath the cap. Eliminate pooling of surface water on the surface of the cap.
- (d) Incorporate planning for future development, such as site grading, utilities, surface water drainage systems, landscaping and terracing, into design and construction of the cap to the extent possible.
- (e) Fence and plant low lying shrubs in areas determined to be too steep to cap (e.g., the east and west gully slopes of the stack hill). Apply a geotextile material to the soil to provide erosion protection, as well as a means for supporting vegetative development.
- (f) Perform mitigation activities if wetlands or aquatic ecosystems are adversely impacted by soil removal or capping. Evaluate the feasibility of setting aside areas on the slag peninsula to allow marine birds to feed and roost.
- (g) Maintain the cap.

Demolish all of the remaining buildings and structures on the smelter site. The sequence of building demolition and construction of the OCF will be determined during remedial design.

- (a) Prior to demolition, inspect all remaining buildings and structures to locate and identify all asbestos-containing material (ACM). Remove ACM from the on-site buildings and dispose of it off-site in accordance with applicable federal and state requirements.
- (b) Vacuum and wash buildings and structures at the Site before beginning demolition activities. Wash areas of structures containing dust that are inaccessible for vacuuming to curtail dust emissions. Collect wastewaters generated from the dust suppression system at each demolition site and route to a wastewater evaporation system, or dispose in an appropriate manner.
- (c) Reactivate the air monitoring stations which were used during previous demolition activities (e.g., Site Stabilization-Phase 2).
- (d) Use conventional trade demolition techniques for the demolition of, or dismantling of the remaining on-site structures. Use conventional equipment, such as shears, grapples, loaders, and cranes, where necessary to safely and efficiently dismantle the structures.
- (e) Sample all debris from demolition of remaining buildings before disposal. Dispose any material other than wood waste that is determined to be hazardous waste using the TCLP test (e.g., steel, concrete, metal) in the OCF. Dispose debris that is not hazardous waste, but fails the wipe test, either off-site pursuant to a dangerous waste exemption issued by Ecology dated May 23, 1994, or in the OCF. Where appropriate, pressure wash debris. Recycle metal materials that pass both TCLP and the wipe test. Dispose all wood debris in an appropriate off-site disposal facility.

9.3 SURFACE WATER

- (a) Plug and abandon or remove the entire existing surface water drainage system and install a new drainage system, including outfalls, in the smelter site cap to collect or divert water that runs onto the Site from the off-site drainage basins and from precipitation that originates on the site. In addition, ensure that seeps on the stack hill and other areas of the Site do not run on the Site.
- (b) Monitor surface water quality during and after implementation of repair and replacement of the drainage system, soil removal, and capping. If surface water quality continues to exceed federal and state standards, treatment of surface water will be evaluated.
- (c) Maintain the surface water drainage system.

9.4 SHORELINE ARMORING

Shoreline armoring of the plant site and slag peninsula, see Figure 7-3.

- (a) Determine the extent of shoreline erosion by performing durability tests on the slag (e.g., specific gravity, absorption, accelerated expansion, abrasion tests, freeze/thaw test) and visual observation.
- (b) Determine where shoreline armoring should be placed based on erosion tests.
- (c) Anchor armoring on the slag face on the bayward side of the slag face along the plant site and slag peninsula, as appropriate, to prevent erosion of the slag due to currents, waves and tidal action. The interior portion of the Yacht Club basin will not require armoring.

- (d) Remove abandoned structures, debris and waste (treated pilings, cables) near the shoreline along the slag peninsula as necessary.
- (e) Mitigate or compensate for shoreline armoring activities that may result in adverse impacts to intertidal habitat. Identify and analyze potential mitigation measures following the guidelines under the Clean Water Act and the state's hydraulic code rules. EPA will work during the design phase of the cleanup with the federal and state trustees of natural resources to develop a mitigation plan.

Required mitigation measures to remedy the impact to the marine environment from shoreline armoring may include shoreline pull back and sloping, development of pocket beaches, mudflats, vegetated shallows, and shoreline irregularity, and may occur on-site or off the Asarco property.

- (f) Maintain the shoreline armoring.

9.5 GROUND WATER AND MARINE SEDIMENTS

- (a) Continue monitoring surface water and ground water and sampling marine sediments. Future sampling programs may include further monitoring of marine sediments to evaluate whether discharges from the Site after this cleanup are continuing to contaminate the sediments. Remedial measures to address offshore sediments will be included in a separate ROD.
- (b) To control contaminants from entering the deeper ground water, EPA directed Asarco in December 1994 to "abandon" the production well, a deep well in the central area of the site that supplied water for smelter activities. Abandoning the well involved making small holes in and filling the well casing (the walls of the well) with grout, a concrete-like material.

9.6 OTHER ELEMENTS OF THE SELECTED REMEDY

9.6.1 Safety Measures

During cleanup, safety measures include, at a minimum, air monitoring with Hi-vol and PM10 air particulate monitors, using dust suppression techniques during excavation and disposal activities, lining and covering truck beds when transporting contaminated materials on public roads, removing soils from truck wheels before they travel on public roads (for example, from the stack hill area to the lower Site), developing a transportation plan to establish local truck routes to minimize disruption to the community, and temporarily storing hazardous waste on-site in compliance with waste pile requirements.

9.6.2 Integrating Cleanup With Land Use Plans

Develop an enforceable program of restrictions and guidelines to supplement the actual cleanup activities. Such measures are necessary to ensure that development activities do not affect the long-term effectiveness of the cleanup and will include, but are not limited to the following:

- (a) Establish a maintenance and monitoring program to ensure the continued integrity of the low-permeability soil cap, the OCF and shoreline armoring.
- (b) Establish guidelines to ensure that future cleanup measures (including, if necessary, remediation of ground water and/or surface water) will not be prevented or hindered by development activities.
- (c) Establish guidelines for conducting construction and maintenance activities to ensure that little or no remaining contamination is exposed or released during future (post-cleanup) excavation. Develop additional guidelines to identify the appropriate actions if contaminant exposure or release occurs (e.g., Asarco's responsibility for disposal of contaminated soil). Activities addressed by these procedures will include installation of underground utilities, basements or elevator shafts and roadways.

- (d) Use deed restrictions to prohibit the use of ground water at the Site and to ensure compliance with the program and guidelines described in (a), (b), and (c) above.
- (e) Develop public educational materials and markers or signs for future users and occupiers of the Site. The materials and markers or signs will describe the cleanup and explain what the users and occupiers should and should not to maintain the effectiveness of the cleanup.

9.6.3 Periodic Review

The protectiveness of the cleanup will be reviewed at least every five years.

9.7 CLEANUP SCHEDULE

EPA estimates that the selected remedy will take five years to complete. It is possible that soil removal and/or capping in one area of the Site (for example, the stack hill or parking lot) can be completed so that development activities can start prior to completion of the cleanup of the entire Site.

EPA will not allow development to begin in any area, however, until it determines that cleanup in that area is complete, that development is safe given cleanup activities taking place elsewhere on-site, and that development would not interfere with potential cleanup measures in the future.

9.8 COST OF THE SELECTED REMEDY

EPA estimates that the cost to perform the Selected Remedy will be \$45.3 million. These costs are estimated and are considered to be accurate to within -30% to +50%. Costs are described using the present worth methodology with a discount rate equal to five percent. The cost estimate includes direct and indirect capital costs, as well as annual operations and maintenance costs. Operation and maintenance (O & M) costs have been estimated for 30 years but O & M activities will be required in perpetuity. See Section 8(7) and Table 8-2 for a more complete breakdown of costs.

9.9 PERFORMANCE STANDARDS

The final Site cleanup levels will be adjusted so that the overall cancer risk from all of the media and the exposure pathways will be equal to or less than 1×10^{-5} and the non-cancer effects will be equal to or less than 1.0

PLANT SITE SOILS

In order to obtain the Cleanup Objectives described in Section 6.7, performance standards and/or remediation goals have been established for each medium that will be cleaned up.

Source Areas. The boundaries of the source areas that require excavation generally will be defined by soils that exceed hazardous waste levels as determined by the TCLP test, see below, and by practical limits on excavation, see Section 8 - Implementability. If soils outside the source areas exceed hazardous waste levels, EPA will evaluate whether further excavation is warranted. These numbers do not represent remediation goals but rather serve as markers for areas to be excavated. Because all areas of the Site will be addressed by soil/slag removal, the OCF, or the Site cap, specific remediation goals for PSS have not been selected.

Chemical	mg/L
Arsenic	5.0
Cadmium	1.0
Chromium	5.0
Lead	5.0
Mercury	0.2
Selenium	1.0
Silver	5.0

The entire site, excavated source and non-source areas, will be capped. The cap will meet the requirements described herein. If, however, after excavation, soil in the stack hill area is below levels comparable to the action levels set for the Ruston/North Tacoma cleanup, a less stringent cap using only soil and a vegetative cover will be required. "Comparable" levels will be determined by EPA and Ecology.

Cover System

A low hydraulic conductivity layer including a minimum of one (1) feet of compacted soil over the soil and slag with a maximum hydraulic conductivity of 1×10^{-7} cm/sec, which is to be designed, constructed, operated and maintained to maximize removal of water by the overlying drainage layer and to minimize infiltration of water into the contaminated soil, and slag.

A drainage layer of at least .5 feet or greater granular drainage materials with a hydraulic conductivity of 1×10^{-2} cm/sec or equivalent. The drainage layer, which is placed above the low hydraulic conductivity layer, must be designed to minimize the amount and residence time of water coming into contact with the low hydraulic conductivity layer, thereby decreasing the potential for leachate generation.

A top cover comprised of two (2) layers. The top component is vegetation designed to impede erosion while still allowing surface runoff from major storm events. The lower component is a minimum of one (1) foot of soil capable of sustaining plant species that will minimize erosion.

The cover system must be designed and constructed to meet the following performance standards:

- (a) Prevent direct contact of people, animals, and surface water with contaminated soils and slag.
- (b) Prevent contaminated soil from being wind-blown.
- (c) Provide long-term minimization of migration of liquids through the Asarco Smelter site.
- (d) Function with minimum maintenance.
- (e) Promote drainage and minimize erosion or abrasion of the cover.
- (f) Accommodate settling and subsidence so that the cover's integrity is maintained.
- (g) A construction quality assurance (CQA) program shall be established for the cover system to ensure that the constructed cover meets or exceeds all design criteria and specifications.

Modifications of the cover system in areas where development will occur will need to be approved by EPA on a case-by-case basis.

Post Closure Care

Maintain the integrity and effectiveness of the final cover, including periodic inspections and making repairs to the soil cap as necessary to correct the effects of settling, subsidence, erosion, or other events.

Prevent run-on and run-off from eroding or otherwise damaging the final cover.

CONTAINMENT FACILITY

The following performance standards are based on requirements in 40 C.F.R. Part 264 for hazardous waste landfills.¹⁰

¹⁰ Specific references to federal regulations only are set forth in this section. The requirements of this section are intended to also comply with state requirements for landfills set forth in WAC 173-303-665.

A composite top liner including a minimum of one (1) foot of compacted soil with a maximum hydraulic conductivity of 1×10^{-7} cm/sec overlain by a flexible membrane liner.

A composite bottom liner including a minimum of three (3) feet of compacted soil with a maximum hydraulic conductivity of 1×10^{-7} cm/sec overlain by a flexible membrane liner designed to prevent the migration of hazardous constituents into the upper components.

The upper component of the top and bottom composite liner will be designed and constructed to prevent migration of hazardous constituents into this component during the active life and post-closure period. The lower component of the top and bottom composite liner will be designed and constructed to minimize the migration of hazardous contents if a breach in the upper component were to occur.

The liner system shall be designed and constructed to comply with 40 CFR Sections 264.301 (a) (1) (i), (ii), and (iii) to assure that it is engineered to withstand the chemical and physical stresses it will be subjected to while containing the waste. The liner system shall be located, designed, constructed, and operated to be completely above the seasonal high water table.

Leachate Collection and Removal System (40 CFR Sections 264.301(c) (2)) and 264.301(c) (3) and (iv))

The leachate collection and removal system immediately above the top liner must be designed, constructed, operated, and maintained to collect and remove leachate from the landfill during the active life and post-closure care period. It shall be designed and operated to ensure that leachate depth over the liner does not exceed one (1) foot.

The leachate collection and removal system immediately above the top liner shall be designed and constructed to comply with 40 CFR Sections 264.301 (c) (3) (iii) and (iv) to assure that it is engineered to withstand the chemical and physical stresses it will be subjected to and to minimize clogging.

Whether leachate will be treated and discharged on-site or disposed off-site will be determined during remedial design.

Leak Detection Collection and Removal System (40 CFR Sections 264.301(c) (3) (i-v), 264.301 (0) (4), 264.302, and 264.304).

The leak detection, collection and removal system in between the liners shall be constructed with a bottom slope of one percent or more of granular drainage materials with a hydraulic conductivity of 1×10^{-2} cm/sec and a thickness of 12 inches or more, or with synthetic or geonet drainage materials with a transmissivity of 3×10^{-5} m²/sec or more and it shall be constructed with sumps and liquid removal methods that shall be operated to minimize the head on the bottom liner system in accordance with 40 CFR Sections 264.301 (c) (3) (v) and 264.301 (c) (4). An action leakage rate and response action plan will be established for the. OCF in accordance with 40 CFR Sections 264.302 and 264.304 to address design flow rates in the leak detection system which will result in a head greater than a foot on the bottom liner system.

The leak detection, collection and removal system in between the liners shall be designed and constructed to comply with 40 CFR Sections 264.301 (c) (3) (iii) and (iv) to assure that it is engineered to withstand the chemical and physical stresses it will be subjected to and to minimize clogging.

Surface Run-on Control System (40 CFR Sections 264.301 (g) and (i))

Design, construct, operate and maintain a run-on control system capable of preventing flow onto the active portion of the landfill during peak discharge from at least a 25-year storm. Collection and holding facilities which are associated with this system must be emptied expeditiously after storms to maintain design capacity of the system.

Design, construct, operate, and maintain a run-off management system to collect and control at least the water volume resulting from a 24 hour, 25-year storm. Collection and holding facilities which are associated with this system must be emptied expeditiously after storms to maintain design capacity of the system. Discharges to Commencement Bay shall comply with surface water performance standards.

Control of Particulate (40 CFR Section 264.301 (j))

The OCF shall be operated to control wind dispersal of contaminated soil, slag and debris placed in it.

Monitoring, Inspection, and Construction Quality Control (40 CFR Sections 264.303, and 264.19)

A CQA program shall be established for the OCF to ensure that the constructed unit meets or exceeds all design criteria and specifications in accordance with 40 CFR Sections 264.19 and 264.303. The landfill systems must be inspected during operation and the leak detection system after closure. Inspection of the landfill during operations will be in accordance with 40 CFR Section 264.303.

Cover System (40 CFR Sections 264.310 and 264.19)

A composite low hydraulic conductivity layer including a minimum of two (2) feet of compacted soil over the waste with a maximum hydraulic conductivity of 1×10^{-7} cm/sec overlain by a flexible membrane liner designed, constructed, operated and maintained to maximize removal of water by the overlying drainage layer and to minimize infiltration of water into the contaminated soil, slag and debris in the OCF.

A drainage layer of one (1) foot or greater granular drainage materials with a hydraulic conductivity of 1×10^{-2} cm/sec and a thickness of 12 inches or more, or with synthetic geonet drainage materials with a transmissivity of 3×10^{-5} m²/sec or more overlain by filter layer to prevent clogging of the drainage layer. The drainage layer, which is placed above the composite low hydraulic conductivity layer, must be designed to minimize the amount and residence time of water coming into contact with the composite low hydraulic conductivity layer, thereby decreasing the potential for leachate generation.

A top cover layer comprised of two (2) layers. The top component is vegetation designed to impede erosion, but allowing the surface runoff from major storm events. The lower component is a minimum of two (2) feet of soil capable of sustaining plant species that will minimize erosion.

The cover system must be designed and constructed to meet the following performance standards specified under 40 CFR Sections 264.111 and 264.310:

- (a) Minimize the need for further maintenance.
- (b) Control, minimize or eliminate, to the extent necessary to protect human health and the environment, post-closure escape of hazardous waste, hazardous constituents, leachate, contaminated run-off, or hazardous waste decomposition products to the ground or surface waters or to the atmosphere.
- (c) Provide long-term minimization of migration of liquids through the closed OCF.
- (d) Function with minimum maintenance.
- (e) Promote drainage and minimize erosion or abrasion of the cover.
- (f) Accommodate settling and subsidence so that the cover's integrity is maintained.
- (g) Have a permeability less than or equal to the permeability of any bottom liner system or natural subsoils present.

- (h) A CCA program shall be established for the OCF cover system to ensure that the constructed cover meets or exceeds all design criteria and specifications in accordance with 40 CFR Section 264.19.

Closure Certification and Post Closure Care of the OCF (40 CFR Sections 264.310, 264.115, 264.116, 264.117, 264.118, 264.119, and 264.120)

The closure certification, monitoring, operation, maintenance and record keeping requirements of 40 CFR Sections 264.310, 264.115, 264.116, 264.117, and 264.118 must be adhered to after closure of the OCF. The post-closure period for the OCF shall be indefinite.

DEMOLITION/EXCAVATION/DISPOSAL

- (a) Air. Hi-vol and PM10 air particulate monitors will be used to confirm that the following levels are not exceeded.

Chemical	mg/L ¹¹
Arsenic	02
Lead	0.75
PM10	75

- (b) Dust Control. A "no-visible dust" standard will be in effect.

¹¹ The arsenic levee is based on 5×10^{-5} risk-based levels over a 10 year period The lead level is based on $\frac{1}{2}$ the allowable PSAPCA level. PM10 levels are based on half of the quarterly allowable 24-hour allowance.

SURFACE WATER

The remedial goals identified for surface water in EPA's September 1993 document entitled, "EPA's Preliminary Remedial Action Objectives," (Table 9-1) are the performance standards that surface water discharging into Commencement Bay must meet. Whether a mixing zone for point source discharges is necessary will be determined during remedial design.

Shoreline Armoring

Minimize the release of slag particles into the bay.

Ground Water

The preliminary remediation goals for Class III ground water impacting surface water (water that is not suitable for drinking) (Table 9-2) will be used as a benchmark to determine the effectiveness of source control activities. Final groundwater remediation goals will be selected in a final ROD for ground water.

TABLE 9-1. REMEDIATION GOALS FOR SURFACE WATER IMPACTING PUGET SOUND

CONTAMINANT	REMEDIATION GOAL	
	(μ /L)	REFERENCE
Arsenic	2.0	MTCA B, PQLa based on the CRDLb
Beryllium	1.0	MTCA B, CRDL
Cadmium	8.0	MTCA B, WQS for aquatic life
Chromium VI	50	MTCA B, WQC/WQS for aquatic life
Copper	10.0	MTCA B, PQL based on EPA Method 1220.2 which has an IDL of 1.0 to 2.0

10.1 PROTECTION OF HUMAN HEALTH AND THE ENVIRONMENT

The selected remedy will eliminate, reduce, or control exposure to contaminants on the Site at the former Asarco Smelter facility. Risks from exposure to soil, slag, and surface water will be eliminated by removing and isolating source area soils, capping contaminated soil and slag, demolishing the remaining buildings, replacing the existing drainage system with a new drainage system and armoring portions of the shoreline.

An enforceable program consisting of legal, engineering and administrative restrictions and guidelines will also be developed to supplement the actual cleanup activities. This program is required in order to assure that the cleanup activities remain protective (e.g., cap, armoring and OCF maintenance), to prohibit certain activities (e.g., drinking ground water), and to address the residual risk of the contaminants left on site.

Accordingly, the selected remedy is protective of human health and the environment.

10.2 COMPLIANCE WITH ARARs

The selected remedy will attain ARARs under federal and state law (see Table B-8 in Appendix B). Compliance with requirements for selection of cleanup actions under MTCA are discussed in Section 10.4 below. The interim measures waiver will be used for the state ARAR for restoring ground water. EPA will select a final remedial action for ground water that will attain the ARAR or provide a justification for its waiver.

10.3 COST-EFFECTIVENESS

The cost of the selected remedy is proportional to its overall effectiveness and it represents a reasonable value for the money to be spent. EPA made this determination by Comparing the cost and effectiveness of treating soil versus disposing untreated soil and debris in an OCF based on the significant community support for on-site disposal.

EPA believes that excavating soil from the source areas is the key step to reducing contaminant concentrations in ground water and surface water. How to dispose of the contaminated soil has been the most significant issue in this cleanup. Treating contaminated soil with a solidification/stabilization process will bind contaminants in a cement-like mixture (but will not detoxify or reduce concentrations). Contaminants in treated soil are unlikely to move out of the soil into other media. The treated soil can be used as sub-base for a site cap. The estimated cost of treating soil is \$38.2 million. If soil treatment were selected, the estimated cost for off-site disposal of contaminated debris (which cannot be treated) is \$12.7 million, for a cost of \$50.9 million. ¹²

¹² The \$50.9 million is in addition to the estimated cost of \$22.5 million for the "essential elements" of the remedy (see Section 8.7 above).

Both soil and debris can be disposed in an OCF. The OCF option will attain a similar objective to treatment, which is minimizing the movement of contaminants into other media, by containing the contaminated soil in a large on-site landfill. The most significant technical difference between treatment and the OCF is that active measures, other than monitoring, would not have been necessary for the treated soil but a permanent operation and maintenance (O&M) program is required to maintain the integrity of the OCF. The O&M program will be a legally enforceable component of the cleanup. The estimated cost for disposal in an OCF is \$22.8 million.

The difference in estimated costs between the treatment and OCF options is \$28 million. EPA concludes that because the ability of the OCF to isolate contaminants from the environment is as effective as treating contaminated soil, and because of the strong community support/or on-site disposal, the OCF is a cost-effective solution.

It should be noted that the estimated cost to transport and dispose soil and debris in an off-site landfill is \$75.1 million, over \$50 million higher than the OCF option. Although off-site disposal would permanently avoid all potential problems associated with leaving contamination on-site, EPA believes that, in comparison, the OCF still represents the best value

for the money. This determination is also based on the fact that significant contamination, e.g., 15 million tons of slag would remain at the Site even if contaminated soils from the source areas were disposed off-site. Off-site disposal does not mean that problems at the Site are eliminated.

EPA has determined that the other components of the selected remedy are also cost-effective because they represent a reasonable cleanup value for the money.

10.4 UTILIZATION OF PERMANENT SOLUTIONS, AND ALTERNATIVE TREATMENT TECHNOLOGIES TO THE MAXIMUM EXTENT PRACTICABLE

The NCP states that this requirement is fulfilled by selecting the alternative that is protective, complies with ARARs, and provides the best balance of trade-offs in terms of the five balancing criteria (numbers 3 through 7 in Section 8.0). The modifying criteria (numbers 8 and 9) shall also be considered. Under MTCA Section 173-340-360(5), very similar criteria are used to select permanent solutions to the maximum extent practicable and to select from among the hierarchy of cleanup technologies in 173-340-360(4).

Again, the crucial decision at this Site is how to manage soil excavated from the source areas and demolition debris. The alternatives range from treating soil to disposing soil and debris, without treatment, in an OCF, to disposing soil and debris off-site. EPA believes that each of these alternatives is protective and complies with ARARs. For the following reasons, EPA has determined that disposing soil and debris, without treatment, in an OCF provides the best balance of trade-offs considering the balancing and modifying criteria, (e.g., community acceptance).

The most important differences in the alternatives are with respect to long-term effectiveness, cost, and community acceptance. Treating soils with a solidification/stabilization technology appears to be effective in preventing the movement of contaminants out of soils into other media. Treatment will not destroy or reduce the toxicity of contaminants, thus requiring long-term monitoring to ensure that treatment remains effective. Treated soils might have been put back on the Site as sub-base for a cap but not in areas where construction is likely to occur, making it less accommodating of future uses than an OCF. The estimated cost of treatment is \$38.2 million, plus \$12.7 million for disposing debris that cannot be treated, for a total of 50.9 million. In addition, during the 90-day public comment period, approximately 830 out of 900 local residents, businesses and local officials supported an OCF and future development of the Site.

Disposing soil and debris in an off-site landfill would be the most effective solution for the Site over the long-term because the problems associated with on-site management of this soil and debris would be eliminated. It is, however, important to remember that regardless of which alternative is selected, an estimated 15 million tons of slag, which contains hazardous substances, and contaminated soil not within the source areas will remain at the Site because it is impracticable to remove and dispose it elsewhere. Although slag and non-source area soil currently contribute less than the source areas to groundwater contamination, these are still contaminated areas that cannot be left alone. Their contribution to groundwater contamination can further be reduced by capping these areas. Thus, even if EPA selected off-site disposal of soil and debris, long-term management of the contamination that remains on-site would still be an important component of EPA's cleanup. Off-site disposal, excluding management of remaining slag and soil on-site, is estimated to cost \$75.1 million. In addition, 830 out of 900 commenters supported an OCF and future development of the Site.

The OCF option, which consolidates the most contaminated soil and debris in a landfill on-site, is an effective solution over the long-term if it is designed and constructed properly and continuous attention is paid to its operation and maintenance.¹³ Its estimated cost of \$22.8 million is significantly less than the \$50.9 million for treatment and the \$75.1 million for off-site disposal. Further, Asarco has demonstrated that the OCF can be constructed on-site so as not to interfere with plans for future development of the property. Comments from individuals and groups in the community overwhelmingly endorsed this approach because of their desire to see such development at the Site. Accordingly, because it is an effective method to isolate contaminants from the environment, costs significantly less than other options, and is most accommodating of future uses desired by the community, EPA has determined that the OCF option provides the best balance of tradeoffs and, therefore, is the permanent solution to the

maximum extent practicable for cleanup of the Asarco Site. For the same reasons, under MCL, selecting disposal in an engineered facility is appropriate even though immobilization of hazardous substances is more preferred in the regulations.

EPA has determined that other components of the selected remedy are also permanent to the maximum extent practicable.

- 13 EPA's analysis shows that treating soil before it is placed in an OCF does not provide significant benefits in terms of reducing contaminants moving into the environment should there be a structural failure of the OCF in the future. Therefore, this option has not been selected. See Section 7.2 and Appendix D.

10.5 PREFERENCE FOR TREATMENT AS A PRINCIPAL ELEMENT.

As explained in Section 10.4 above, none of the components of the selected remedy will satisfy the preference for treatment. If treatment of surface water is necessary in the future, the preference for treatment would be satisfied.

11.0 DOCUMENTATION OF SIGNIFICANT CHANGES

In the Proposed Plan, EPA recommended treatment of contaminated source area soils because treated soils did not significantly leach above regulatory levels and EPA believed that the community and the elected officials were strongly opposed to an OCF based on meetings held in the community over the past several years. During the public comment period on the Proposed Plan, EPA received comments from the majority of the public and their elected representatives strongly encouraging the selection of an OCF in lieu of soil treatment (solidification/stabilization) and disposal.

The two approaches for these soils are comparable in terms of their overall protectiveness but differ primarily with respect to their cost and compatibility with future land use and community acceptance. For the reasons stated above, EPA's selected remedy provides for the on-site containment of excavated source area soils. Soils will not require treatment before disposal in the OCF.

In the Proposed Plan, EPA recommended that the slag shoreline along the Asarco Site and the slag peninsula be armored with riprap. During the public comment period, several commenters wondered whether the shoreline was eroding, whether the erosion was causing an adverse impact on the adjacent marine sediment and if more harm than good would be caused if by adversely impacting existing habitat which lived on the current slag face.

Several commenters questioned whether the slag shoreline was eroding, whether the eroded slag particles caused an adverse impact on the adjacent marine environment, and why the shoreline needed to be armored since it is already providing a suitable habitat for marine biota. If shoreline armoring was determined to be necessary, commenters also questioned how it would be anchored to the existing slag face and why riprap (large rocks) was selected instead of artificial beach nourishment (small rocks and sand) to armor the slag.

After evaluating the comments received and finding out that a shoreline monitoring station, consisting of large rocks piled against the shoreline was destroyed by tidal action and strong shoreline currents, EPA still believes that some amount of shoreline armoring will be necessary to prevent erosion of slag particles, which cause adverse effects to marine organisms in the Bay. However, EPA has determined that before the design of the shoreline armoring begins, additional data should be collected to determine (1) the extent of shoreline erosion; (2) how and where armoring should be placed; and (3) the impact of armoring to the existing marine biota versus the impact of not armoring slag to the marine biota over time. EPA will encourage other state and federal resource agencies and community groups to participate in the development of the shoreline armoring.

APPENDIX A

The U.S. Environmental Protection Agency (EPA) has written this Responsiveness Summary to respond to public comments received regarding the Proposed Plan for cleanup of the former Asarco Smelter Site. EPA initially held a public comment period from August 12 through October 11, 1994. At the request of members of the community, the comment period was extended to November 10, 1994. This document reflects all of the comments that were either voiced at one of the two public meetings held during the comment period, or submitted in writing. Questions that were asked and answered at the public meetings, held on August 30 and September 19, 1994, are recorded in the meeting transcripts, and are not included in this document. The transcripts are available in the Administrative Record for the Site is located at EPA Region 10, the Main Branch of the Tacoma Public Library and all of the Information Repositories listed in Table B-1 in Appendix B.

In addition to EPA's efforts, Asarco solicited public comments on EPA's Proposed Cleanup Plan as well as on an "Agreement in Principle" between the company and local governments for future development of the site. Comments received by Asarco in response to its request have been summarized and are included with Asarco's comments on the Proposed Plan, Section 3.0 of this document. The Responsiveness Summary meets the requirements of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980 as amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA).

1.1 SITE BACKGROUND

The former Asarco Smelter project is part of the Commencement Bay Nearshore/Tideflats Superfund Site in Tacoma, Washington. The Commencement Bay Site was placed on the National Priorities List (NPL) in September 1983. The Asarco Smelter Facility and the adjacent Tacoma Yacht Club breakwater (slag peninsula) are located along the shoreline in Tacoma and Ruston, Washington.

The former Asarco Smelter Site (the Asarco Site) consists of the 67-acre smelter property and the 23-acre adjacent peninsula. Many of the facility buildings and structures were erected on slag fill (a black, rock-like byproduct from the smelting process), which extended the existing shoreline when molten slag material was poured into Commencement Bay during smelting operations. An estimated 15 million tons of slag exist on the smelter property and along the slag peninsula.

Metal smelting and refining operations were active at the Asarco Site from the late 1800s until 1985 when the smelter facility was closed. During that time, lead and copper were refined from metal-bearing ores and by-products of the smelting operations were further refined to produce other marketable products such as arsenic, sulfuric acid and sulfur dioxide. Metals and organic compounds were released into the air, soil, and Commencement Bay as a result of these operations. Metals in the slag, or that were released into the soil have migrated into the Bay and into groundwater underneath the Asarco Site.

Over the past several years, samples of soil, slag, surface, and groundwater have been taken at the Asarco Site. Elevated concentrations of heavy metals and some organic compounds were detected in soil and slag throughout the property as well as in the Bay, groundwater and off-shore sediments. The contaminants of most concern for possible effects to public health and the environment include: arsenic, cadmium, chromium, copper, lead, nickel, silver, zinc, and dimethylaniline.

Samples show that the principal threat to human health and the environment is the contaminated material in the "source areas." EPA and Asarco have identified the following six source areas: the Stack Hill, Copper Refinery Area, Cooling Pond, Arsenic Kitchen, Fine Ore Bins Building, and the Southeast Area of the Plant. These are areas that have the highest known concentrations of metals and/or organic compounds and continue to act as the primary known sources of contamination to the Bay and groundwater. Elevated arsenic concentrations ranging up to 403,100 parts per million (ppm) were detected in soil samples at one source area at the Asarco Site. Highly mobile organic compounds are also considered a principal threat because they are leaching out into surface and groundwater that is flowing into Commencement Bay.

Cleanup actions are necessary at the Asarco Site because it currently poses long-term cancer risks for workers, possible future visitors or residents, sealife, and animals. EPA has

selected a comprehensive cleanup strategy in order to address the multiple sources of contamination at the smelter property and along the slag peninsular EPA identified a range of alternatives (series of choices) to achieve cleanup objectives and goals for the Asarco Site. These alternatives are summarized in Table 7-1 of the Record of Decision. EPA has evaluated the choices and public comments on the Propose Plan, and has selected the Phase I (source control) cleanup remedy for the Asarco Site. In addition to evaluating cleanup options, representatives of Asarco, the City of Tacoma (Tacoma), the Town of Ruston (Ruston), and the Metropolitan Park District (the Park District) have formed a "land use committee" which has negotiated an "Agreement in Principle" that calls for preparation of a consensual Master Use Plan for future development of the Asarco Site after cleanup.

1.2 PROPOSED PLAN FOR CLEANUP

One of EPA's objectives in issuing the Proposed Plan is to enable the public to participate in the process for selection of a cleanup approach for the Asarco Site. Public comments are solicited to determine whether the range of approaches is adequate, whether the discussion of differences between approaches is reasonable and comprehensive, whether EPA has made good choices in developing a preferred alternative, and whether the choices made will meet community objectives for the Asarco Site.

In developing the Proposed Plan, EPA considered the following nine legally mandated Superfund evaluation criteria:

- (1) Overall protection of human health and the environment;
- (2) Compliance with federal and state environmental standards;
- (3) Long-term effectiveness and permanence;
- (4) Reduction of toxicity mobility, or volume through treatment;
- (5) Short-term effectiveness;
- (6) implementability;
- (7) Cost;
- (8) State acceptance; and
- (9) Community acceptance.

The Preferred Alternative, outlined in EPA's Proposed Plan, addressed contamination of plant site soils, the slag peninsula, groundwater, and surface water. It was based on the alternatives summarized in Table 7-1 in the Record of Decision, plus additional elements that EPA believes were necessary for a comprehensive cleanup. The individual components of the Preferred Alternative included excavation and treatment of soils from the source areas; disposal of soil and other materials; capping the entire Asarco Site; demolition of the remaining buildings; replacement of the entire surface water drainage system; shoreline armoring of the plant site and slag peninsula; abandonment of the production well; monitoring of surface and groundwater and sampling of marine sediments; safety measures; integration of cleanup with land use plans; cleanup schedule; and costs.

1.3 SELECTED REMEDY

EPA has carefully evaluated all of the cleanup alternatives and public comments received on the Proposed Plan, and has selected a cleanup remedy to control the source of contamination at the Asarco Site. This selected remedy is Phase I of the comprehensive cleanup plan, and is described in detail in Section 9.0 of the Record of Decision. In general, the selected remedy for source control of the contamination at the Asarco Site includes excavation of source area soils, demolition of the remaining buildings and structures, disposal of the source area soils and demolition debris in an on-site containment facility (OCF) which meets or exceeds regulatory standards for hazardous waste landfills, cap the entire Site except for the OCF which has its own cover, replace the entire surface water drainage system, armor portions of the plant site and slag peninsula shoreline, continue to monitor the surface water and groundwater, sample marine sediments and develop and implement an enforceable program of restrictions and guidelines to supplement the actual cleanup activities to ensure that the remedial action remains protective.

1.4 SUMMARY OF COMMUNITY INVOLVEMENT AND CONCERNS

EPA has placed a high priority on community involvement because many Ruston and North Tacoma

property owners and residents may be affected by EPA's chosen cleanup approach. EPA recognizes that, in addition to cleaning up contamination at the Asarco Site, the community is very interested in the future use of this property. Although the primary mission of the EPA is to design a cleanup that protects human health and the environment, EPA believes that this can be accomplished with future development of the Asarco Site in mind. To achieve this goal, significant citizen participation has been important to EPA's process for selecting a remedy. The following activities were undertaken by EPA to seek public input:

- Availability Sessions where citizens could visit one-on-one with EPA and Asarco to discuss cleanup plans,
- Meetings with interested small groups to discuss investigation findings and cleanup alternatives;
- Interviews with individual citizens to improve understanding of community concerns;
- A 90-day public comment period to provide citizens with an opportunity to review the Proposed Plan and other documents related to the cleanup and submit comments to EPA;
- Two public meetings, held on August 30 and September 19, 1994, to answer questions and obtain citizen input on EPA's Proposed Plan; and
- Meetings with the Ruston/North Tacoma Coordinating Forum which is comprised of representatives from local, state and federal municipalities or agencies.

Transcripts of the August 30 and September 19 public meetings and the public comment letters and cards received by EPA are part of the Asarco Smelter Administrative Record, which is available for viewing at EPA Region 10, the Main Branch of the Tacoma Public Library and all of the information repositories listed in Table B-1 in Appendix B. In general, the commenters expressed concerns about the soil, groundwater, and surface water contamination, and its health effects; the longevity and stability of on-site containment/disposal; the effects on future land use; and issues involving the cleanup plan design, costs, and benefits to the community from future development.

The next six paragraphs provide a summary of comments received and are followed by a detailed response section to specific comments. During the comment period, numerous commenters expressed preferences regarding the cleanup of the contaminated soils. Some commented specifically in relation to the future development of the Asarco Site. Many commenters stated a preference for on-site containment of the contaminated soils, reasoning that only by approving the less expensive OCF alternative would there be money left over to develop the Asarco Site. Many stated a preference for on-site containment, reasoning that an OCF is safe, environmentally effective, and the most economical alternative. Other commenters opposed on-site containment because of concerns regarding the stability, longevity, and safety of an OCF, and stated that development should not be an issue in choosing the best cleanup decision. Several commenters felt that the development money Asarco has offered may have already tainted the cleanup decisions of EPA and the local communities. Other commenters suggested that a combination of on-site containment, treatment, and/or off-site disposal would be the most effective remedy for the contaminated soils and other materials.

Contamination in the groundwater, surface waters, and sediments was a concern of some of the commentors; they felt that EPA did not adequately address this issue in the Proposed Plan and offered opinions and suggestions regarding the remediation of these areas.

Many commenters voiced their opinions or suggestions regarding the proposed treatment of soils at the Asarco Site. Some commenters expressed a preference for on-site treatment prior to disposal; others opposed on-site treatment because of issues regarding stability, post-cleanup monitoring, and cost of treatment. Several commenters made suggestions of alternative treatment methods for the contaminated soils.

Many commenters also voiced their opinions and offered suggestions regarding the nature of future development at the Asarco Site. Some commenters expressed appreciation for the efforts of Ruston, Tacoma, the Park District and Asarco in negotiating a Master Development Plan and

were eager to see development of the site. Other commenters disagreed, referring to the plan as a "bribe" to the nearby residents of Ruston and Tacoma to influence their acceptance of a less expensive OCF without treatment.

Some commenters expressed appreciation for past and current efforts on the part of EPA and Asarco; others expressed criticism of one or both organizations. Several commenters indicated disapproval of Asarco and what they viewed as action motivated only by organizational self-interest, which was seen as running counter to public interest. Some commenters expressed the opinion that Asarco had excessively endangered public health in its pursuit of profits. Asarco provided comments to EPA that are included in Section 3 of this Responsiveness Summary. Additional public comments received by Asarco are also included in this section. The next section (Section 2) provides detailed responses to public comments communicated verbally during the public meetings, and written communications received by EPA during the 90-day public comment period.

2.0 PUBLIC COMMENTS AND EPA RESPONSES

2.1 SOIL TREATMENT

1. COMMENT: Several commenters recommended against treatment of contaminated soil. Several commenters questioned the long-term effectiveness of the proposed soil treatment. Some commenters stated that encapsulation/stabilization is an unproven technology, is difficult to monitor over the long-term, does not reduce the volume of the contaminants, and/or is not cost effective. Some commenters expressed the opinion that there may be serious risks if the resulting mixture were spread over the Site, because the small concrete particles may break down with an end result that is worse than the current situation. Several commenters added that this would have a devastating impact on future Site development. One commentator also stated that, due to the unknown long-term effectiveness of stabilization, this option does not meet the nine evaluation criteria.

RESPONSE: Although EPA is not selecting soil stabilization/solidification for the Asarco cleanup, it has been used at a number of Superfund sites around the country. These technologies are relatively new, such that no data exists that would show how the stabilized material would hold up 50 or 100 years from now. However, tests have been developed to simulate conditions in the future.

EPA believes that many commenters expressed a valid concern about the future monitoring of the treated soils if the soils were placed in various areas beneath a site cap. Although EPA believes that an effective monitoring system could be designed to detect if treated soils were contributing to groundwater contamination, it believes that the leak detection and collection system for the OCF is better with respect to identifying any future problems. Monitoring any Superfund remedy over the long-term always presents site specific challenges and EPA believes that a successful monitoring program can be developed for the Asarco cleanup.

2. COMMENT: A few commenters, including the City of Tacoma Environmental Commission and Citizens for a Healthy Bay (CHB), expressed the opinion that long-term monitoring of the Asarco Site after the cleanup activities were completed would be more difficult and costly if the soil were treated because the treated material would be placed throughout the Site. CHB also expressed the concern that deed restrictions would be necessary.

RESPONSE: In EPA's original proposal, treated soils would have been consolidated in the excavated or other areas on the Site not impacted by groundwater, not spread around. The groundwater monitoring program that EPA would have required for treated soils would have been equivalent to that selected for the OCF.

Deed restrictions and institutional controls will be necessary regardless of the remedy selected because some hazardous contaminants will remain on site under all of the alternatives.

3. COMMENT: Several commenters stated a preference for on-site treatment of metals and other contaminants of concern prior to disposal. One commentator cited off-site health risks, Potentially Responsible Party (PRP) liability, and cost benefits as reasons for on-site treatment.

RESPONSE: EPA has selected disposal of excavated source area soils in an on-site containment facility (OCF) without requiring soil treatment prior to disposal. As discussed in section 7.2. in the Record of Decision (ROD), EPA compared the potential movement of contaminants out of the OCF of treated and untreated soil. EPA found that the potential difference in leachate between treated and untreated soil disposed in an OCF was minimal if the good quality of the cap and bottom liner was maintained.

EPA believes that disposing the source area soil in an OCF and capping the rest of the Site will alleviate any potential health risks to adjacent neighborhoods. Asarco will be responsible for the cleanup regardless of the remedy selected. Most of the public comments received supported an OCF more than soil treatment because an OCF cost less and would allow future development to occur. EPA believes that the additional cost for soil treatment would not result in a more effective remedy over the long-term.

4. COMMENT: One commentor suggested that EPA perform a series of small pilot tests to determine the effectiveness of the proposed treatment on the contaminated soil prior to engaging in final cleanup activities.

RESPONSE: In May 1994, EPA, Asarco and Asarco's contractor ITEX, conducted a pilot-scale treatment project that solidified approximately 500 cubic yards of soil at the former Asarco Smelter Site. The results are described in Appendix C of the ROD. Additional information can be found in section 2.5 of the Administrative Record.

5. COMMENT: One commentor expressed concern that treating the soil with lime may create a different mixture of contaminated elements, and wondered if the EPA has conducted tests to ensure that this does not occur.

RESPONSE: The pilot-treatability study used lime, or calcium oxide, as one of the primary additives. EPA found that "a different mixture of contaminated elements" was not created, rather the metals were simply bound up within the cement. The results of this study can be found in the Asarco Smelter Administrative Record and are described in Appendix C of the Record of Decision (ROD).

6. COMMENT: Citizens for a Healthy Bay (CHB) does not support soil stabilization and commented that there are no assurances that the treated soil will remain stable and will not leach 10, 50, or 100 years from now. They stated that the long-term leachability of the stabilized material is difficult to determine because the method used to evaluate the long-term mobility, the Municipal Waste Extraction Procedure (MWEP), utilizes a 30-day test, and the results of some of the leachability tests were not made available to the public.

RESPONSE: MWEP and the Toxicity Characteristic Leaching Procedure (TCLP) are reasonably good predictors of future leaching, but the treatment technology is so new that actual results of how well treatment works over a long period of time are not available. EPA believes that the MWEP and ANS 16.1 water leaching tests, which are frequently used today at municipal waste facilities, are good predictors of the future impacts of rainwater and surface water coming into contact with treated soils. A summary of the results of both of these tests are attached in Appendix C and the complete document is located in the Administrative Record for this Site.

7. COMMENT: The Tacoma-Pierce County Health Department stated that it would only support treatment if EPA could assure that treatment would be a "permanent fix that would never leach."

RESPONSE: EPA cannot make this guarantee for either disposal option for contaminated soils at the Site. The only alternative that may be able to meet this criterion is "off-site disposal." However, off-site disposal is much more expensive than other available options. Further, even with off-site disposal, it is not possible to remove all contaminated material so some contaminated soil and slag would still remain on Site and need to be capped. For more information on the reasons for this decision to select an OCF, see Section 8.0 in the ROD.

Alternative Treatment Methods

8. COMMENT: Several commentors indicated that additional treatment technologies exist to remove and/or destroy metals in the soil and that these technologies should be considered in the cleanup plan. Citizens for a Healthy Bay (CHB) requested that the time to consider

different cleanup options at the site be extended to assess the results of alternative treatment studies and allow for public review. CHB also requested that copies of all information received by EPA regarding treatment technologies be sent to their office for review and publication. Two commentors stated that the public comment period should be reopened when the results of any treatment technology are received by EPA.

RESPONSE: Under an EPA Administrative Order on Consent, Asarco conducted a literature search for treatment technologies which would eliminate metal contamination from soils at the former smelter site (see the "Treatability Literature Study Report," May 12, 1992 in Section 2.5.5 of the Administrative Record). Through this literature search it appeared that soil stabilization/solidification was the most appropriate treatment technology for the contamination at this Site. During the public comment period, another treatment vendor claimed that his company's soil-washing technology could remove the metals from the soils for approximately the same cost as on-site containment. EPA has been working with this vendor since the first public meeting, but as yet, has not received additional information which indicates that this treatment process is effective. EPA has informed the vendor of its continued willingness to receive information. The additional soil treatability information on the MWEF test was sent to Citizens for a Healthy Bay. EPA did extend the public comment period for an additional 30 days.

9. COMMENT: Several commentors suggested that chemically extracting the metals from some of the more contaminated soils would be an environmentally and economically sound alternative to stabilization and/or land disposal.

RESPONSE: To date EPA has not identified a chemical-extraction process which is effective for the metals which are found on Site.

10. COMMENT: Several commentors suggested a variety of additional treatment technologies for contaminated soils and/or groundwater. Some of the soil technologies recommended are: (1) bioremediation, (2) combining the metal-contaminated soil with excavated clay and melting the mixture in an on-site kiln, (3) "closed incineration" which is used by oil companies, and (4) the use of any in-situ technologies where possible. In addition, a commentor suggested using wet oxidation of organics, electro-filtration of heavy metals and ozone treatment for groundwater.

RESPONSE: EPA required Asarco to conduct a treatability literature search report, see reference in Response No. 8. In this report all of the applicable technologies for treatment of metals contamination in soils were evaluated.

- (1) Bioremediation. EPA believes that the commentor is referring to the bioremediation of metals in an artificial wetland environment. If this is the case, there are microbes that can be used to alter the oxidation state of metals, which in some cases may result in the metals becoming less mobile, but this process would not remove the metals from the environment. Biological treatment of leachate that is generated at some sites has also been used, but this type of treatment does not favorably impact the source of the contamination. Conceptually, *Desulfouibrio* spp. (a type of microbe) can cause metals to be precipitated in sulfides, but this type of treatment has not been shown to be effective on the type or concentrations of waste at the smelter site.
- (2) In-situ vitrification of metals in soil, or combining clay with contaminated soils at high temperatures, was explored, but determined not to be cost-effective. One company, Geosafe, has conducted field demonstrations (small scale) of soil vitrification, which would bake the soil into a slag-like matrix. This has not been proved to be effective at full-scale yet.
- (3) Closed Incineration. EPA spoke to the project manager of "Seaview" (Bluebell, Pennsylvania) who developed the technology for "incinerating" hazardous compounds, primarily hydrocarbons, found in off-shore drilling materials. This process involves heating the contaminated materials until the hydrocarbons are burned out of the sediments. EPA does not believe that this treatment process would be effective for treating the contaminated soils found at the Asarco Site.

- (4) In-situ technologies, such as soil flushing or vitrification could potentially be used at the Site. However, environmentally dangerous chemicals (e.g., strong acids and chelating agents) would have to be used for soil flushing and it would be necessary to be absolutely sure that all of these chemicals could be captured before they discharged into the bay. Additionally, this could be a lengthy and expensive process due to the high metal concentrations found at this Site.

Following completion of the actions under this ROD, EPA will evaluate the need for remedial measures for surface and groundwater. If surface water treatment is necessary, Asarco will be required to evaluate these approaches, along with others. In-situ treatment technologies will be considered where appropriate.

11. COMMENT: One commentor suggested using sulfur instead of lime in the proposed treatment, because the higher pH of lime would increase the solubility of arsenic.

RESPONSE: EPA recognizes that sulfur chemicals are another set of treatment reagents that could be used to produce insoluble species of arsenic. Like the cement and lime based solidification methods, sulfur reagents have to be tested to make sure they are compatible with the particular waste that is being treated. The concerns that EPA has with sulfur chemicals are (1) the treated soil would be "soil-like" which would mean that surface/groundwater would be more likely to come into contact with the treated soil particles and (2) although sulfides are stable in a low oxidation environment, if they are exposed to air, the sulfides can oxidize and release a more soluble form of arsenic and sulfate.

2.2 ON-SITE CONTAINMENT FACILITY (OCF)

12. COMMENT: Numerous commentors expressed their support of the Master Development Plan and stated a preference for on-site containment without treatment. A majority of the commentors reasoned that only by approving the less expensive alternative would there be money available to invest in development of the Asarco Site. In addition, some people expressed the opinion that, besides saving money, on-site containment without treatment would save time. Other commentors reasoned that, as the soil treatment and OCF options are equally protective, the additional dollars that would be required for treatment are better spent on preparing the land for development. One person added that an OCF can always be dug up later if it is determined to be a hazard.

RESPONSE: EPA is required to select a remedy which is protective of human health and the environment. Both soil treatment and on-site containment are protective cleanup options. In this case, EPA further considered the compatibility of protective cleanup plans with future land use plans. EPA believes that the future use of this Site is important and has tried to select cleanup activities that will not prevent reasonable future uses of the Site. EPA has also considered the cost effectiveness of the alternatives. However, it should be noted that EPA's determination that the selected remedy is cost-effective is based on a comparison of the various cleanup approaches described in the Proposed Plan, not on Asarco's ability to afford land development activities.

Contrary to the commentors belief, soil treatment would be completed faster than designing and constructing an OCF. The pilot-treatability test indicated that the soil treatment would take approximately 6 months. However excavating and disposing soils in an OCF could take approximately 2 years.

It is true that an OCF could be "dug up" in the future if it is determined that the OCF is not as effective as once thought and/or if a new treatment technology is discovered. However, EPA believes that the likelihood of this happening is small. EPA is selecting a hazardous waste facility (the OCF) as part of its cleanup option because it believes that this unit can be constructed in a manner which will effectively isolate the waste from the environment and be protective of human health and the environment over the long-term.

13. COMMENT: Several commentors questioned the integrity and effectiveness of on-site disposal, stating that OCF technology is still new and unproven and other waste disposal sites, over time, have all experienced leakage. Two people cited the example of Gas Works Park in Seattle, where the public was assured the soil was safe, but the soil was later discovered to be unsafe and had to be removed at great expense to the taxpayer. Another commentor referred to an

example several years ago when Tacoma encouraged the development of apartments near its refuse site. The contaminants eventually surfaced and the public had to purchase the apartments at a high price following lawsuits. Additionally, several commentators questioned the leachability of contaminants to groundwater and surface waters from an OCF.

RESPONSE: Many of the landfills which have failed in the past have been municipal solid waste landfills that have not been constructed with multiple liners and caps which would be required at the Asarco Site. These landfills have contained a variety of wastes (e.g., solids, liquids, and hazardous constituents). Over time, many of these incompatible wastes have mingled creating either the release of toxic leachate or methane gas. The OCF, which has been selected for this Site, will not contain different types of wastes, rather it will contain "inert wastes" (wastes that are not chemically reactive with each other) such as contaminated soil and demolition debris (excluding wood). Since the metals in the source area soils have been found to become mobile when water passes through them, it will be important to design a cap which strictly controls surface and groundwater infiltration.

14. COMMENT: Several commentators raised questions regarding the stability of an OCF or landfill in what they considered to be the probable event of a major earthquake. One of these commentators expressed the belief that, due to the geology of the area, an earthquake-triggered (or other naturally-occurring) slide would carry contaminated materials into the bay. One commentator wondered if the Site was fundamentally suited for an OCF.

RESPONSE: Preliminary seismic evaluations of the smelter plant area were conducted during the Feasibility Study. These evaluations indicate that this area is suitable for an OCF (e.g., it is not located on a fault line). However, an additional seismic evaluation of the area where the OCF will be constructed will be a requirement of the Remedial Design/Remedial Action work plans that are developed after the ROD is signed.

15. COMMENT: Several commentators expressed the opinion that if the OCF alternative is chosen a multiple cell approach should be used, with the more contaminated soils stored and/or treated and disposed in a separate cell. They reasoned that this approach would allow for one more level of protection for a leaking OCF and enable removal of the contaminated soils in the future if necessary. Another commentator added that separate cells would offer more precise monitoring capabilities, because the contaminated material ranges over three orders of magnitude in contaminant concentration. Another commentator suggested that, by using separate cells, the more contaminated soils could be treated when new technologies become available.

RESPONSE: Because the type of material to be placed in the OCF is relatively similar (metal contaminated soil and debris) EPA does not believe that there are significant advantages to storing the waste in separate cells. Segregating soils based on the metals concentration may be appropriate if there were a promising soil treatment technology pending and EPA believed that certain soils would be a good candidate for treatment. However, this is currently not the case.

The reasons that landfills are normally separated into multiple cells is to (1) separate incompatible wastes and the leachate from those wastes and (2) to limit the open portion of a large landfill that will operate over many years so as to limit the area available for collection of precipitation. Under this scenario, each cell would be constructed and covered prior to constructing another cell. Neither of these reasons are relevant to the Asarco OCF as the waste to be placed is not incompatible and the duration the OCF will be open is short.

16. COMMENT: One commentator stated that EPA did not present soil treatment before disposal in an OCF as an option in the Proposed Plan, and that treating the most contaminated soils may be a way to mitigate the high costs of remediation and still allow for future development.

RESPONSE: EPA presented this alternative, soil treatment before disposal in an OCF, in Section (H) (7) of the Proposed Plan. The estimated cost of this alternative was \$65.5 million. When the Proposed Plan was issued, EPA did not believe that it would be necessary to dispose treated soil in a hazardous waste landfill. Therefore, the costs of disposing treated soils were calculated based on a solid waste landfill. This cost was \$70.2 million because hazardous demolition debris would still need to be properly disposed off-site. Disposing treated soil and debris would be more expensive than using an OCF.

17. COMMENT: Two commentors expressed concern that tourists, families, developers, and/or restaurateurs would be hesitant to visit or build on a hazardous waste site that may potentially leak.

RESPONSE: The hazardous waste to be disposed in the OCF would be isolated from potential access by people through a multilayer cover and the legal restrictions requiring that the cover be maintained. Further, as part of the future land use activities sponsored by Asarco, Tacoma, Ruston and the Metropolitan Park District, interviews were conducted with bankers and future developers to determine if there would be a market for development on a remediated Superfund site. The research indicates that constructing an on-site landfill does not appear to pose significant barriers to future uses of and investment in the Site.

18. COMMENT: One commentor stated that the option of including both soil and demolition debris in an OCF should have been presented in EPA's evaluation of cleanup options.

RESPONSE: This option was included in EPA's Preferred Alternative, on page 14 in Section (G) (1) (b) and (c).

19. COMMENT: One commentor suggested that the "ditch" leading up to the railroad tunnel would be an ideal location for the OCF, because it is unattractive and in need of remediation.

RESPONSE: EPA does not believe that this would be an "ideal" location because the gully located on the south side of the stack hill is private property and may potentially be considered a wetland. In addition, there are many areas along the hillsides where groundwater exits and creates small ponds and marshes at the base of the gully. It is important to select an area for disposal of contaminated materials where surface water and groundwater can be controlled.

20. COMMENT: One commentor inferred that, because Hydrometrics (the contractor hired by Asarco to design the OCF in the Feasibility Study) is a subsidiary of Asarco, their assurances regarding the safety and stability of an OCF cannot be taken seriously.

RESPONSE: EPA expects Hydrometrics to perform all of its work in accordance with appropriate professional standards regardless of who owns the company. In addition, EPA and its own Consultant, ICF/Kaiser Engineers, Inc., have carefully reviewed Hydrometrics' work to ensure that Hydrometrics' data-gathering, analyses, findings, and conclusions, including with respect to the construction of an OCF, have been performed in accordance with acceptable methods and legal requirements. Further, EPA's in-house technical personnel have conducted their own independent analysis of an OCF and have concluded that it can be constructed in a manner that is protective of human health and the environment.

21. COMMENT: One commentor requested that EPA provide an example of an OCF that has been around for 50 years in a geographically similar area and exposed to an equivalent amount of water runoff. He also added the question: If the soil is so stable, why then is there contamination in the surface water?

RESPONSE: Because there were no requirements for double-lined landfills with separate leachate detection and collection systems before 1984, specific examples of the performance of double-lined landfills more than 10 years old are not available.

The contamination that is found in the surface water is primarily from soil particles being carried by the water (total metals) and not from metals leaching off soil particles into the water (dissolved metals).

22. COMMENT: One representative from the Washington and North Idaho District Council of Labor expressed opposition to on-site containment because of the poor labor relationship that his union is currently experiencing with Hydrometrics or Asarco.

RESPONSE: EPA has no authority to mediate-labor disputes between Asarco and its contractors. EPA requires, however, that Asarco comply with worker health and safety requirements at all times during performance of cleanup work.

23. COMMENT: One commentor supported the use of pre-stressed concrete in the construction of an OCF.

RESPONSE: Although concrete liners and caps could be constructed to prevent contaminants from migrating out of the OCF or prevent water from migrating into the OCF, concrete has a higher tendency to fracture. If this occurred in the liner, it would be irreparable, whereas clay has the capability to reseal itself if water were to contact it in the future. Experience has demonstrated that concrete, or asphalt caps, generally require more maintenance than clay and synthetic caps.

24. COMMENT: One commentor stated that concentrating contaminated residential soils in an OCF close to the shoreline would further aggravate the local environment.

RESPONSE: Residential soils will not be disposed in an OCF, but will be used as a sub-base to the low permeability cap (see Figure 7-1 in the ROD) that will be placed on the Site.

25. COMMENT: One commentor asked if releases from an OCF could be monitored if the Site is already contaminated and wondered if existing contamination would make it more difficult or unlikely to detect leaks from an OCF.

RESPONSE: EPA has many years of groundwater data from this Site that can serve as a baseline prior to construction of the OCF. EPA plans to continue groundwater monitoring before, during and after cleanup. Therefore, we will be able to evaluate the groundwater contamination trends before and after construction, of the OCF. In the event that contaminants begin to leach out of the OCF, they will be detected as increases above then existing conditions via the groundwater monitoring program.

26. COMMENT: One commentor stated that a hazardous waste facility, under Resource Conservation and Recovery Act (RCRA) siting requirements, would not typically be in a wet climate with full public access and immediately adjacent to an exceptional water body, such as Commencement Bay. For these reasons, if soil treatment is ineffective, the proposed OCF should be modified to use additional clean soil as a cover to diminish future exposure, with the contaminated soils segregated by level of contamination into separate cells. This commentor added that the OCF should be built like any other RCRA facility, with the soils receiving the same amount of treatment as would be required if they were to go to the RCRA facility in Arlington, Oregon.

RESPONSE: EPA agrees that a new hazardous waste landfill typically would not be sited in this type of location, assuming that the area was relatively clean. EPA and the State try to avoid introducing contaminants to pristine or clean areas. But the smelter site is not such an area and it is generally recognized that a significant amount of contamination, such as 15 million tons of slag, cannot be removed from this location. Accordingly, EPA believes that construction of a landfill in accordance with federal and state requirements at this location, given existing contaminated conditions, is an acceptable part of the overall cleanup. EPA is not requiring treatment of soil prior to disposal in the OCF because the OCF can effectively isolate the soil from the environment, see Section 9.9 of the ROD. See Response to Comment No. 15 regarding construction of separate cells.

27. COMMENT: One commentor stated that the siting decision for the OCF needs to carefully consider the hydrogeology of the Asarco Site. An impermeable structure, such as an OCF, is likely to alter the current groundwater system and raise the water table around the OCF. He expressed the opinion that the OCF should not be constructed atop a shallow aquifer if other more protective locations exist. Other commentors wondered if there would be any way to pump out water that may seep into the OCF before it moves from the OCF into Commencement Bay.

RESPONSE: All groundwater and surface water which currently flows across or through the central area of the Site, where the OCF will be located, will be rerouted through new drainage systems or diversion trenches. It is not likely that the groundwater table will rise as a result of these activities.

In addition, a thick silt aquitard lies beneath the shallow aquifer in this location and will prevent rerouted or displaced groundwater from migrating to the deeper aquifer.

The OCF will be designed so that groundwater is unlikely to come into contact with the OCF and so that surface water (rain water) will be diverted. In addition, EPA believes that the minimal amount of leachate which may be generated inside the OCF will be handled by the leachate

collection and removal system before it is released into the groundwater of the bay.

28. COMMENT: A few commentors believe that EPA should consider the potential for including contaminated sediments in the OCF. In contrast, the Town of Ruston commented that it is opposed to using the OCF for the disposal of dredged, dewatered marine sediments, due to the necessity of reopening a closed OCF, the potential for adverse chemical reaction with materials in the OCF, and its adverse impact on future development. Tacoma, the Metropolitan Park District and Asarco also opposed disposing sediments in the OCF.

RESPONSE: At this time, it has not been determined that off-shore sediments need to be dredged and disposed. However, Ruston, Tacoma, the Metropolitan Park District and have presented several reasons why this material should not be disposed in the OCF should dredging and disposal be required in the future: (1) the sediments will be very wet and may introduce water into the OCF that could mobilize the metals on the soils, and (2) there may not be enough room remaining in the OCF after the soils and demolition debris are disposed. Although sediments could be dried before they are disposed, it is unlikely that sufficient capacity could be added for the sediments without interfering with land use plans. For these reasons, EPA agrees with the commentors opposed to disposing sediment in the OCF. Other alternatives for disposing dredged sediments will be evaluated by Asarco and EPA.

29. COMMENT: One commentor stated that because the Tacoma Asarco Smelter processed ores that other smelters did not want, all of the contaminated soils should be consolidated on the site.

RESPONSE: EPA agrees that consolidation of soils on site makes sense but not necessarily for the reason provided by the commentor.

30. COMMENT: The Puyallup Tribe of Indians (the Puyallup Tribe) is concerned that the construction of an OCF before implementation of a source control strategy may preempt the future remediation of groundwater, therefore they request the construction of the OCF not occur until after the groundwater studies are completed. The Tribe stated that a source control strategy must develop specific plans for control of permitted and unpermitted point source and non-point source discharges and that "No remediation should begin unless source control can be implemented and enforced." The Tribe added that the cleanup of this Site must ensure that there will be no further pollutants entering the environment from any source.

RESPONSE: The Tribe appears to be stating that EPA should directly reduce levels of contaminants in surface water and groundwater prior to removing contaminated soil and constructing an OCF for disposal of such soil. The Tribe's concept of "source control" appears to be to treat contaminated surface water and groundwater prior to discharge.

EPA agrees with the Tribe's proposed result but not with its recommended sequence of cleanup activities. Because contaminated soils existing at the Site are the primary source of contaminants found in surface water and groundwater, EPA believes it is important to first remove the most contaminated soils from the primary source areas and isolate them from surface water and groundwater so the connection between the sources of contamination and the discharges to Commencement Bay is severed.

After the sources are removed and isolated in the OCF, the entire Site is capped, and a new surface water drainage system is installed, EPA will monitor the levels of containments in discharges from the Site. If these levels continue to exceed acceptable requirements, EPA will determine what further actions, including water treatment, are necessary to reduce the discharge of contaminants into Commencement Bay. EPA notes that the cleanup levels for surface water are consistent with the Tribe's water quality standards. By promulgating its water quality standards, the Tribe appears to recognize that there are acceptable levels for pollutant discharges other than "no further pollutants."

2.3 CAPPING

31. COMMENT: One commentor preferred that Asarco cap the land "as is" rather than excavating and consolidating the contaminated soils.

RESPONSE: The soils located in areas identified by EPA as "source areas" have very high concentrations of contaminants which are mobilized by contact with groundwater. In order to address the significant groundwater problem at the Site, EPA believes it is necessary to remove these soils before capping the entire Site.

32. COMMENT: There were several comments regarding the capping materials that were proposed to be used for a Site cap. Two commentators believe that the "clean" soils from Pt. Defiance are probably also contaminated with Asarco emissions; another commentator was concerned about contaminants from the excavated Study Area soils potentially leaching into the Bay and another commentator suggested that contaminated sediments as well as Study Area soils should be included in the cap.

RESPONSE: All soils used for the top layers of the cap will be sampled to verify that they are clean. Although the Ruston/North Tacoma soils do not leach metals into surface water or groundwater, EPA believes that the cap will protect the contaminated soil particles from being washed into the bay by surface water. At this time, EPA is not sure whether sediments will need to be dredged or not.

33. COMMENT: Several commentators expressed the opinion that the capping or OCF soil cover should be greater than 2 feet so more substantial vegetation can be planted on top without breaching the cap. One commentator added the opinion that a 1-2 foot soil cap would not be sufficient to ensure permanent protection of construction, public access, utility work, and other activities that may occur on site.

RESPONSE: The total thickness of a multilayer soil cap is at least two and a half feet; for an OCF the thickness is at least five feet. The 1-2 foot soil cap required for the OCF would be in addition to filter material, one foot of drainage material, a fabric liner and two feet of compacted clay. For the soils cap, the one foot of clean soil would be in addition to 6 inches of gravel and one foot of clay. EPA notes that plans for development of the Site may result in even thicker layers of soil in the cap or above the cover of the OCF.

34. COMMENT: Two commentators stated that clay capping is susceptible to cracking. One of these commentators suggested using a geomembrane liner in combination with the low permeability soils as a substitute for clay capping. A few commentators are concerned about sulfide formation if anything other than a "soil only" cap is used or if waste is buried deeper than four feet (sulfides increase the possibility of a "reducing" environment).

RESPONSE: Although clays that dry out are susceptible to cracking, the advantage of clay is that once surface water does begin to migrate through the cracks it rehydrates the clay and the cracks are resealed. Although synthetic liners are often used in conjunction with clay, it is for this reason that synthetics are rarely used alone. A synthetic liner may be used as part of the cap and liner of the OCF and will not be used as part of the site wide cap.

EPA has not experienced sulfide formation at sites where wastes were buried deeper than four feet. Also, see Response to Comment No. 11.

35. COMMENT: The Tacoma-Pierce County Health Department's comment letter expressed the opinion that the placement of contaminated residential soils under a cap containing one foot of low permeability soils is not appropriate because the soil would be considered dangerous waste if generated elsewhere in the state. It stated that the original plan was for the residential soils to be disposed at an off-site landfill and asks how this fits into the proposal to use soils as fill material on the Asarco Site. The Town of Ruston supported using Ruston/North Tacoma soils as a sub-base for a cap on the Site.

RESPONSE: The Health Department later clarified its comment to EPA's project manager and stated that their primary concern about the Ruston/North Tacoma residential soils was their potential to leach. After EPA explained that the data indicated that these soils do not significantly leach above regulatory standards with acid or water extraction, the health department representative agreed that the proposed method of disposal was sufficient.

The Ruston/North Tacoma Study Area Record of Decision (June, 1993) stated that the residential soils would be disposed off site unless an alternative method of disposal was selected in the ROD for smelter cleanup. To determine whether it would be acceptable to the community, EPA proposed

using these soils as a sub-base for a cap in the Proposed Plan for the Smelter Cleanup.

36. COMMENT: One commentor suggested that the contaminated Ruston/North Tacoma soils should not be placed under future parks, open space, or in areas such as streams crossing the Site.

RESPONSE: Since these soils will be beneath a protective cap, EPA believes that these types of restrictions for the placement of residential soils are not necessary. In the event that trees or vegetation that have deeper roots will be planted in parks or open spaces, the thickness of the soil covering can be modified appropriately. Presently, EPA is not aware of any streams crossing the Site.

37. COMMENT: One person was concerned that capping soils in place may still allow contaminants to leach into groundwater aquifers and the bay. He stated that the soil should be removed if the concentrations are dangerous.

RESPONSE: The most highly contaminated soils will be excavated. The Site soils which will not be excavated do not appear to be primary sources of groundwater contamination. However, because rainwater does contact these soils, soil particles are washed into the bay. EPA believes that a clean soil and clay cap will prevent rainwater from coming into contact with the contaminated soils and will prevent contaminated soil particles from washing into the bay.

38. COMMENT: A commentor stated that the cap should be designed to accommodate underground parking.

RESPONSE: EPA's paramount interest is maintaining the integrity of the cap. If an underground parking lot can be constructed so as not to compromise the integrity of the cap, EPA will consider it along with other land uses that may be proposed.

2.4 SHORELINE

39. COMMENT: One person commented that the entire slag face should be securely enclosed so that no leaks are possible.

RESPONSE: If a non-permeable (leak proof) barrier of some type is placed securely against the slag face a "bathtub" effect will be created on the Site. Right now, hundreds of gallons of groundwater move through the Site each day. Placing a barrier at the slag face would cause this water to back up. EPA believes that the shoreline armoring approach will prevent erosion, but still allow groundwater to move into the bay.

40. COMMENT: The Washington Department of Natural Resources (DNR) expressed the opinion that the alteration of the existing shoreline during Site cleanup, as described in the Proposed Plan, may result in the exposure of new slag faces. They believe that this may lead to additional contamination of the bay due to increased toxicity and mobility of contaminants, as well as increase the volume of slag requiring treatment/disposal. DNR cannot support any activities that would create freshly exposed slag and believes that this issue has not been adequately evaluated in the nine criteria analysis. DNR recommended that a quantitative analysis of leaching associated with freshly exposed slag be performed prior to finalizing any plans to cut back the slag.

RESPONSE: EPA anticipates that at least some shoreline armoring will be necessary. EPA shares DNR's concern about exposing too many freshly cut surfaces to bay water since this is the condition when metals in the slag are most leachable. Prior to armoring, EPA will determine if significant erosion is occurring. If it is, and armoring is necessary, DNR, other Natural Resource Trustees, and interested members of the community will be asked to be involved in the development of the remedial design work plans associated with shoreline armoring.

41. COMMENT: DNR stated that armoring and careful design aimed at creating an area which habitat would repopulate is preferred without cutbacks which may lead to further contamination of Commencement Bay.

RESPONSE: EPA agrees with this recommendation.

42. COMMENT: One commentor stated that implementability criteria, overall protection of

human health and the environment criteria, community acceptance criteria, and land use plans have not included the analysis of shoreline armoring design.

RESPONSE: Analysis of this alternative has been included in Section 8.0 in the ROD. However, EPA agrees that additional studies will be necessary to determine the extent and location of armoring and the specific design for anchoring the toe (bottom) of the riprap.

43. COMMENT: Citizens for a Healthy Bay and other commentors stated that the Preferred does not give an adequate description of the remediation proposed for the shoreline. They suggested that before the ROD is written, more information regarding the range of alternatives considered, the benefits and drawbacks of each alternative, and site-specific information regarding how this or any other alternative would be implemented needs to be made publicly available. They also questioned whether the riprap will be placed on top of, the existing slag face, or if the slag face will be cut away and then covered with riprap as shown in the feasibility study.

RESPONSE: In the ROD, EPA has modified the Proposed Plan's approach with respect to shoreline armoring based on public comments received. Before developing the design for shoreline armoring, Asarco will be required to conduct additional studies to determine where and to what extent the shoreline is eroding. Sections of the shoreline that are significantly eroding will be armored. At that time, site-specific information will be collected to determine whether cutbacks are necessary and how the riprap will be anchored in order to design the armoring. Citizens for a Healthy Bay, the Natural Resource trustees and other members of the public will be encouraged to participate in this process. Also, see Responses to Comment Nos. 40 and 41.

44. COMMENT: The Puyallup Tribe agreed with the proposal for shoreline armoring. Another commentor requested that the shoreline armoring requirements be flexible enough to accommodate different shoreline needs.

RESPONSE: The shoreline armoring will be designed to accommodate future land uses. Presentation and mitigation of shoreline habitat will also be an objective of shoreline armoring.

45. COMMENT: One commentor stated that a minimum slope of 2.5 (horizontal) to 1 (vertical) needs to be used for any riprap placed on the slag face. It was further added that the explanation was inadequate regarding how this alternative will be implemented without interfering with future sediment remediation. He also stated that it is unclear as to how the armoring will be held in place.

RESPONSE: EPA has been advised by the Corps of Engineers that in most locations, the steepest slope that should be used for riprap armoring is 1 to 1.5, and that areas with slopes greater than this would require cutbacks. Sequencing shoreline armoring and sediment remediation activities will be necessary but at this time the extent of sediment cleanup is not known. By the time work plans will be required for shoreline armoring design, EPA should know what portion of the sediments are contaminated and how these sediments can be cleaned up (e.g., capping, dredging or natural recovery). In many places a "toe" can be excavated out of the slag in order to anchor the armoring. The specific design details of armoring will be determined at a future date. EPA will encourage members of the community to participate in this process.

Natural Resources

46. COMMENT: Several commentors indicated that more emphasis should be placed on developing a range of alternatives for restoration of the natural habitat of the bay, nearshore, and shoreline areas. One commentor suggested that EPA establish an ambitious whole-watershed restoration program as part of the site remediation plan; one commentor stated that shoreline treatment and natural resource restoration options should be explored before a final cleanup design is developed; and one commentor requested that the effects of shoreline armoring on existing habitat be evaluated.

RESPONSE: EPA will work closely with community members and Natural Resource Trustees to develop a comprehensive design plan to try to address all of the commentors concerns. EPA will evaluate whether the mitigation/restoration sites identified by the U.S. Army Corps of Engineers, EPA, U.S. Fish and Wildlife Service and National Oceanic and Atmospheric Administration (NOAA) in the Commencement Bay Cumulative Impact Study, Volumes I and II (May/June 1993) and the "Vision

Document for Commencement Bay, by the Commencement Bay Cleanup Action Committee (November 19, 1993) are appropriate for the Asarco cleanup.

Although EPA does not believe that "shoreline treatment" is possible, it will identify the effects of armoring on the existing habitat and will explore mitigation opportunities while designing shoreline armoring.

47. COMMENT: Several commentors suggested that the area be returned to a pre-industrial wilderness.

RESPONSE: Although this is a nice idea, it does not appear to be practicable, particularly given the 15 million tons of slag at the Site. EPA's objective is to cleanup the Site so that it will not pose a threat to human health and the environment in the future.

48. COMMENT: Two commentors suggested that the EPA should coordinate its design/cleanup efforts with resource agencies such as National Oceanic & Atmospheric Administration and the Natural Resource Damage Assessment Trustees.

RESPONSE: EPA has been working with these agencies during the RI/FS and decision-making phases and will continue to do so during remedial design and remedial action activities.

49. COMMENT: One commentor expressed the opinion that the alternatives presented (OCF or soil stabilization) are not adequate to accomplish the cleanup correctly. He believes the cleanup should integrate public health issues with the restoration of both aquatic and terrestrial habitats, and the economic thresholds necessary to facilitate quality development.

RESPONSE: The cleanup activities which have been selected are intended to prevent or minimize the contaminant exposure to humans, animals and sealife. Preservation of habitat (or mitigation for adverse impacts to habitat) are also an objective of this cleanup. EPA intends to continue working with the local community regarding the future development of the Site so that "quality development" after the cleanup will also be possible.

50. COMMENT: The U.S. Fish and Wildlife Service commented that they were pleased to see that EPA recognizes mitigation for habitat losses associated with remediation activities as a necessary element in the overall success of the preferred alternative.

RESPONSE: EPA hopes that the U.S. and State Fish and Wildlife Services will continue to be involved in this project.

51. COMMENT: One commentor stated that restoration should be considered while a remediation plan is being developed and that EPA should consider restoring the two natural streambeds that were on the Site. Two commentors requested that as the site remediation plan is finalized, the OCF, liners, and other infrastructure should be made consistent with the restoration of natural streambeds and areas near the shoreline. One commentor suggested that water-sensitive site design that allows natural infiltration of stormwater runoff and reestablishment of natural vegetation be adapted in the location of the two former small streams on the Asarco Site.

RESPONSE: EPA recommends that stream bed restoration be considered under the future development process. EPA notes that CERCLA § 107(f)(1) does not allow for recovery where damages to natural resources have occurred wholly before December 11, 1980. "Natural infiltration" of stormwater runoff is not a good idea if it means that stormwater will come in contact with contaminated soils beneath the Site cap.

Sediments

52. COMMENT: One commentor expressed the opinion that guidelines must be developed for further maintenance and repair of the existing pier structures to minimize impact to sediments.

RESPONSE: EPA's selected cleanup remedy does not address the existing piers. If these piers are to be use for future land use activities, the repair and maintenance will need to be addressed by the Public Development Authority established to oversee future development activities.

53. COMMENT: One commentor advised that plugging the present drainage system should be done in such a manner as to prevent all water from leaching into the pipes and potentially draining into the bay, and that care should be taken to avoid incidental flushing of the contaminated drain sediments into the bay. This commentor also stated that if applicable and relevant and appropriate requirements (ARARs) are not reached through these surface water measures, surface water treatment be required regardless of its cost. He also wondered if any drainage system presently exists on the slag peninsula. The Puyallup Tribe noted that treatment of surface water (and groundwater) would be difficult particularly during peak flows. The design of the treatment system must account for the worst case scenario instead of allowing for waivers of water quality standards or by-passes.

RESPONSE: Under EPA's selected remedy, all of the existing surface water drainage system will be plugged. If the surface water that flows through the new drainage system does not meet the remedial action objectives (see Section 9.9), surface water treatment will be required to the maximum extent practicable. There is no drainage system on the slag peninsula.

54. COMMENT: The Town of Ruston commented that any surface and stormwater management and drainage systems must be designed in consultation with Ruston, Tacoma, and the Park District and meet or exceed all local, state and, federal standards and regulations. The Town of Ruston stated that the surface water drainage system should not be designed as to make routine maintenance and/or any required repair prohibitive.

RESPONSE: EPA will work with the Town of Ruston to accomplish these objectives by involving the Town in development of the Statement of Work and work plans for the design and implementation of the cleanup.

55. COMMENT: The Puyallup Tribe commented that the existing surface water drainage system needs to be plugged and abandoned and a new system constructed. If surface water quality fails to meet federal and state standards, treatment of surface water must be required regardless of cost. The Tribe also requested the creation of detention facilities, such as small streams and drainages, to provide natural areas for wildlife and help control surface water during peak flows. In addition, it requested that Site cleanup ensure that no additional contaminants be released into the environment (e.g., recontaminate the sediments). The Tribe objected to the use of a mixing zone.

RESPONSE: EPA agrees with the need to plug and abandon the existing surface water system and build a new one (see Section 9.3 of the ROD). If surface water cleanup levels are not attained as a result of the new system and capping the Site, the need for treatment will be evaluated.

Detention facilities, silt fences, diversion ditches, cut and fill slopes, will be used as appropriate when soil is being excavated in order to reduce contaminated runoff from excavated areas. Once a soil cap is placed on the Site, EPA will evaluate whether such measures are needed as part of the new surface water drainage system. See Response to Comment No. 51 regarding streams on the Site. EPA believes that construction of a surface water drainage system will prevent the release of contaminants into the bay from surface water. EPA notes that mixing zones are authorized under both state law and Section 9 of the Tribe's Water Quality Standards. Whether a mixing zone is appropriate for the Asarco Site will be determined during remedial design.

56. COMMENT: One commentor stated that the former cooling pond area should be fully remediated to become part of the overall natural area on the Asarco Site, and added that the contaminated soil in the cooling pond area should not be capped in place but removed.

RESPONSE: Approximately seven feet of contaminated soil will be removed from the cooling pond area. If contaminated soil exists beneath this depth it will be capped. Whether this area becomes a "natural area" or a "development zone" will be determined with community participation during future land use meetings.

2.6 GROUNDWATER

57. COMMENT: Several commentors stated that passive treatment of groundwater and surface

water is not adequate and that a source control strategy for point source and non-point source discharges should be implemented prior to commencement of soil remediation. One commentor added that the mass loading of hazardous releases from groundwater and surface water should be fully documented, and a cleanup strategy developed to ensure that contaminants will not continue to enter Commencement Bay. Another commentor requested that the EPA provide more detail on how groundwater will be remediated, and stated that groundwater remediation would result in a significant reduction of ongoing injuries to the bay's natural resources. Two commentors stated that if monitoring reveals that the groundwater fails to meet federal and state standards, the Master Development Plan must allow for the construction and operation of a treatment facility or other contingency plan. The Puyallup Tribe commented that the remediation of soil may interfere with the future remediation of groundwater.

RESPONSE: Efforts to document and evaluate surface water and groundwater contamination are presently underway with the collection of surface water data every month and the collection of groundwater data twice a year. EPA believes that the source control activities will significantly reduce contaminant loading into surface and groundwater. See Response to Comment No. 30 regarding the sequencing of cleanup activities and the basic premise of EPA's source control strategy.

If it is determined that active measures are necessary to clean up surface water and groundwater, a separate analysis and proposal regarding such measures will be issued for public review. EPA does not agree that soil remediation will interfere with the future remediation of groundwater because removal and disposal of soil does not preclude active measures for groundwater.

58. COMMENT: One commentor stated that the preferred alternative will fail to achieve cleanup goals for groundwater because EPA's preferred alternative proposes a waiver of applicable or relevant and appropriate requirements (ARARs) relating to groundwater cleanup and deferral of sediment remediation.

RESPONSE: At this time it is not certain whether source control activities selected by EPA will attain the federal and state groundwater cleanup goals. Accordingly, a temporary waiver of the requirement to meet such goals for this action is appropriate. EPA will continue to monitor the Site and will take the appropriate groundwater cleanup measures if necessary and to the maximum extent practicable.

59. COMMENT: One commentor recommended continual groundwater monitoring at the Site until it is determined that contamination no longer exists.

RESPONSE: EPA and Asarco agreed to a long-term groundwater monitoring plan in October 1994 that requires groundwater monitoring until 1999. EPA anticipates that a cleanup decision for the groundwater will be made by then.

2.7 OFF-SITE DISPOSAL

60. COMMENT: Several commentors expressed a preference for the removal of contaminated soil and off-site disposal citing concerns for the longevity, stability, and future exposure risks of on-site disposal. Some commentors suggested that leaving contaminated materials on site would not provide a permanent solution and would only be a toxic legacy for future generations. Another commentor expressed the opinion that any material hauled off site would be a liability for another community.

RESPONSE: EPA agrees with the commentor's description of the advantages of off-site disposal. But a significant disadvantage is the cost of off-site disposal, nearly \$50 million more than disposal in an OCF. Together with the fact that not all contamination will be removed from the Site under any alternative (e.g., 15 million tons of slag cannot be removed) EPA has determined that the cost-effective cleanup solution at the Site is disposal of source area soils in an OCF and placement of a soil cap over the entire Site.

If materials were disposed off-site, it would most likely be placed in a permitted and regulated hazardous waste facility which has already been constructed and permitted and should, therefore, not be a liability for another community.

61. COMMENT: One commentator expressed the opinion that development of the Asarco Site should not be allowed unless the soil is removed off site.

RESPONSE: EPA believes that the Site can be safely developed if the contaminated soil that remains on site is either isolated in an OCF or capped in place.

2.8 MONITORING/LONG-TERM CONTROLS

62. COMMENT: Several commentators expressed the opinion that any contaminated material remaining on site in an OCF or underneath a cap should be surrounded by monitoring wells and tested regularly. One commentator asked if a program would be established and funded to ensure ongoing monitoring and repairs when necessary. Another commentator wondered who would be responsible for ensuring that the post-cleanup monitoring is performed.

RESPONSE: Fifty-eight monitoring wells are being used for sampling under the long-term monitoring program. EPA and Asarco have agreed to install additional groundwater monitoring wells after source areas soils have been excavated (see the Post-RI Long Term Monitoring Sampling and Analysis Plan," October 1994). All of the wells in the source areas will be sampled quarterly. During the design of the OCF, EPA will ensure that monitoring wells are in appropriate locations to detect problems with the OCF should they occur in the future. Asarco will be responsible for maintaining and repairing all wells as necessary. EPA will ensure that Asarco monitors the Site after all cleanup activities are completed.

63. COMMENT: One commentator suggested that local land trusts, public agencies (Housing Authorities), and environmental groups should be involved in future site monitoring and management responsibilities.

RESPONSE: EPA believes it is most appropriate for Asarco to have responsibility for all future monitoring activities. But, EPA is planning to involve other entities in monitoring and management activities.

64. COMMENT: One commentator suggested that deed restrictions and other legal means for ensuring institutional controls for the Asarco Site need to be strict to ensure a permanent protection for the soil cap placed across the Site and any containment facility built on the site.

RESPONSE: EPA agrees (see Section 9.6.2(a) of the ROD) and will include requirements in the future agreements with Asarco to implement institutional controls including deed restrictions.

65. COMMENT: One citizen commented that the Park District and Tacoma cannot be counted on to keep their promise of post-development monitoring because they have not kept previous promises.

RESPONSE: Asarco will be responsible for conducting all future Site monitoring, including monitoring after the cleanup has been completed.

66. COMMENT: One commentator stated that regardless of whether Asarco treats the soil or disposes it in an OCF; monitoring, cap maintenance, air monitoring, and surface water monitoring must be required.

RESPONSE: EPA agrees that monitoring is necessary; these measures are required in the selected remedy found in Section 9.0 of the ROD.

2.9 HEALTH

67. COMMENT: Two commentators were concerned about health effects from contaminants on site and believe that some of their close family members have suffered from chronic health problems and may have died prematurely as a result of working at the Asarco Smelter.

RESPONSE: EPA expresses its regret for this commentators situation. EPA's cleanup decision is based on the health risks posed by current conditions at the Site. EPA cannot evaluate the extent to which workers' health may have been affected while employed at the smelter, but EPA can assure that any future population which comes into contact with the Site will not be

68. COMMENT: One representative from the Washington and North Idaho District Council of Labor voiced concerns about the health and safety of site workers participating in the cleanup operation. He expressed the opinion that Hydrometrics has demonstrated continuing disregard for worker safety and health concerns by allowing contaminated vehicle/equipment rinse water to be discharged directly into Commencement Bay via storm sewers.

RESPONSE: EPA requires Asarco to submit health and safety plans for all of the cleanup activities that occur on the Site. During any cleanup activities, EPA has an oversight contractor on site to ensure that the work plans and the health and safety plans are being followed appropriately. Any concerns about worker safety should be forwarded directly to the Washington Department of Labor and Industries. See also Response to Comment No. 22. During soil excavation and disposal activities, EPA will require Asarco to control discharges of contaminated water.

69. COMMENT: The Puyallup Tribe requested that EPA take into consideration their hunting, fishing and other subsistence activities on and near the Puyallup Reservation and added that the living resources in Commencement Bay and human population that depends on these resources must not be subject to the bioaccumulation of hazardous chemicals. The Puyallup Tribe also stated that the protection of anadromous fish (species which live in fresh and salt water), on which much of the tribe relies for spiritual subsistence and economic survival, is of paramount importance. The Tribe requested that EPA conduct a fish consumption study prior to issuing the ROD for the smelter cleanup.

RESPONSE: EPA has not evaluated how much fish from Commencement Bay is consumed by the Puyallup Tribe in making its cleanup decisions in this ROD. EPA has agreed, however, to consider this information when making its cleanup decision regarding groundwater.

EPA is and will continue to take into account the concerns of the Puyallup Tribe, which encompass the existence of contamination in all of Commencement Bay, not just that associated with the Asarco Site. EPA has set its cleanup goals at levels which it believes are protective of human health and the environment. Because 'protectiveness' includes minimizing contamination in fish that may be consumed by humans, EPA is particularly focusing on contaminant levels in fish in its continued investigation of marine sediments off-shore of the Site.

70. COMMENT: Two commentors felt that the health risks associated with the contamination of the Asarco Site may be exaggerated because they have not experienced adverse health effects from living near the Site. One commentor suggested that stress from the cleanup process is probably more debilitating than the arsenic contamination, and the other commentor expressed the opinion that EPA should offer a real-life comparisons of the alleged increased health risks from exposure to lead and arsenic.

RESPONSE: The potential health risks that have been identified at the Site in the Risk Assessment are primarily based on predicted adverse effects posed by current Site conditions to potential residents, workers, recreational visitors or trespassers, i.e., people who may spend varying amounts of time at the smelter in the future. Because residents, workers, etc. are not living/working/playing on the Site now, it is not possible to give real-life examples. The evaluation of potential increased health risks from lead and arsenic are summarized in Section 4.2 of the Risk Assessment (Kleinfelder, 1993).

Residential:

71. COMMENT: One person questioned whether or not it is safe to eat home grown produce from the area.

RESPONSE: The Risk Assessment conducted for the Ruston/North Tacoma Study Area indicated that the risk from eating fruits and vegetables that are grown in the area is very small. Precautions which are recommended by the local health department include, thoroughly washing leafy produce such as lettuce, and produce which is grown underground, such as carrots and radishes.

72. COMMENT: One person expressed the opinion that Asarco has been given "special

treatment" because the level of arsenic and lead contamination that it has been ordered to excavate is greater than the Action Levels established by the State.

RESPONSE: EPA believes this commentor is referring to action levels for the residential area. EPA disagrees that Asarco has been given "special treatment." EPA has selected safe cleanup levels for the soils. Decisions regarding the cleanups of both the Ruston/North Tacoma Study Area and the Smelter Site, including the specific determinations of action levels, have been made in accordance with federal and state requirements, and with the concurrence of the Washington Department of Ecology.

2.10 DEVELOPMENT/LAND USE

73. COMMENT: Numerous commentors expressed specific opinions regarding the development that should occur at the Asarco Site after cleanup. One person commented that, if the Asarco Site is beautified, surrounding property values would be elevated and residents would be angered by the resulting increase in property taxes. One commentor expressed the opinion that Asarco is living up to the public trust by their commitment to invest 15 to 20 million dollars beyond the cleanup cost to encourage future development. Another person commented that redevelopment would not compensate for the legacy of pollution that Asarco will leave behind.

RESPONSE: All of the comments received by EPA regarding future development will be forwarded to the Land Use Group which includes representatives from the City of Tacoma, the Town of Ruston, the Metropolitan Park District and Asarco. EPA believes that the cleanup of the smelter site will reverse the legacy of pollution from the operation of the smelter. EPA is not in the position to evaluate the potential for property taxes to change based on Site development activities.

74. COMMENT: Many commentors were concerned that only financial benefits, and not environmental and/or long-term human health considerations, have been considered in the Master Development Plan. Two of these commentors expressed the opinion that the development plan was designed primarily to enable Asarco to save significant cleanup costs. One person commented that when a company pollutes an area so badly it achieves the distinction of worst Superfund site, a cursory cleanup for the sake of profit and added local taxes does not meet the intent of Superfund legislation.

RESPONSE: EPA has selected cleanup measures that will comprehensively address contamination at the Site and that are fully in accordance with the Superfund law. Further, the primary intent of the Master Development Plan is to provide for future development of the Site once cleanup has been completed. Accordingly, other than the need to maintain the protectiveness of the cleanup measures, it is reasonable that the Master Development Plan not focus on environmental considerations.

75. COMMENT: Several commentors suggested that development would hinder remediation of groundwater and surface water and restoration of natural habitat and that development should not be allowed until that portion of the Site is fully remediated. One commentor suggested that the cleanup be modified to include a provision that development may not hinder remediation or restoration, and another commentor stated that development should not occur until the effectiveness of a permanent remedy is clearly established for surface water, groundwater, and sediments.

RESPONSE: The selected remedy requires that development activities not interfere with potential cleanup activities, including the possibility that surface water and/or groundwater treatment will be necessary in the future (see Sections 9.3 and 9.5 in the ROD).

76. COMMENT: Two commentors requested that Asarco separate the cleanup effort from the commercial development of the Asarco site; one of these commentors requested that Asarco acknowledge this separation publicly.

RESPONSE: These two processes are separate but contain common elements: EPA is determining the environmental cleanup of the Site. The local municipalities and Asarco will be facilitating the development of the Site.

However, EPA and the other parties involved recognize the advantage of combining some of the

planning elements for future development with the design of site cleanup activities. For example, if Asarco and the local governments can identify the type and locations of development (number of people, type of services necessary) then it can design the water, sewer, electricity and phone lines at the same time Asarco and EPA are designing a cap for the Site. This will allow the cap, with the necessary utilities, to be installed at one time rather than installing the cap and digging it up later to install utilities.

77. COMMENT: Two people commented that if Asarco conducted the cleanup and did not have enough money left over for development, the Asarco Site' would be redeveloped anyway because it is prime valuable property. Two people added the comment that a pollution free site and community would be the biggest asset to encourage development in the area, and another commentator suggested that Asarco will redevelop the Site based on economic reasons alone, regardless of any "Principles of Agreement" with the local communities. One commentator expressed the opinion that the property would be more valuable if there was not an OCF on the Site.

RESPONSE: By signing the "Agreement in Principle," Asarco and the local governments committed to using their best efforts to develop the property. EPA hopes that all of these parties will honor their commitments and that the former smelter will be returned to productive uses for the community. EPA has no opinion on whether the Site would be redeveloped if Asarco had insufficient funds.

78. COMMENT: The Town of Ruston commented that an important element necessary for future development is EPA providing an appropriate release indemnification from liability for Ruston, Tacoma, the Park District, the Public Development Authority, and future lessees and lenders.

RESPONSE: At the national level, EPA Headquarters is committed to encouraging development and reuse of Superfund sites. National policies and guidance regarding such matters, including the potential liability associated with Superfund sites, are being revised. EPA Region 10 will work with Headquarters' policies and guidance to provide as much certainty to potential owners, investors and tenants at the Asarco Site as possible.

79. COMMENT: The Town of Ruston commented that the design and implementation of remediation must support the Master Development Plan by allowing appropriate areas of the Asarco Site to be cleaned in a timely manner, thus opening these areas to development prior to completion of the remediation of the entire Site.

RESPONSE: EPA's intent is to allow development of the Site in a timely manner. However, EPA's primary concern is the safety and well-being of the site workers, surrounding residents and any potential future users of the Site. Development activities will be allowed to proceed when it is certain they will not interfere with cleanup of the Site.

2.11 COSTS

80. COMMENT: Several commentators expressed the opinion that Asarco has made great financial gains at the expense of the environment and should be held financially accountable for a thorough cleanup. One commentator expressed the opinion that the revenue generated by Asarco during its operation and the revenue that will be generated after development will far exceed the cost of any cleanup.

RESPONSE: Under the Superfund law, Asarco is liable to perform (or pay for) the cleanup selected by EPA. The cleanup must attain specific statutory mandates, including protection of human health and the environment. The amount of money that may have been generated by Asarco while the smelter was operating (or could be generated after cleanup) does not influence the extent of cleanup necessary to be protective and therefore is not considered by EPA when selecting a cleanup.

81. COMMENT: Several commentators indicated that the extra cost for treatment of the contaminated soils should not be a factor in determining the best cleanup alternative.

RESPONSE: One of the requirements for cleanups selected under the Superfund law is that they are cost-effective. EPA uses several factors to determine whether cleanup measures are cost-effective, including comparing the relative costs and effectiveness of various cleanup alternatives. Based on EPA's analysis and review of the comments received, EPA believes that

the additional "effectiveness" provided by treating soils is not worth the increased cost compared to disposing soils in an OCF.

82. COMMENT: One commentor posed two cost-related questions: How much will it cost to treat the soil and store it in an OCF, and how much will it cost to clean the aquifers?

RESPONSE: EPA estimates that it would cost \$70 million to treat source area soils, dispose the treated soils in an on-site solid waste landfill, and dispose the demolition debris in an off-site hazardous waste landfill. (This option is approximately \$20 million more than soil treatment/disposal beneath the Site cap and \$47 million more than soil disposal without treatment and debris disposal in the OCF.)

Asarco has estimated that the cost of pumping and treating groundwater for 2 years and 30 years at \$15.6 million and \$20.1 million, respectively. Using an in-situ (in place) groundwater treatment method would cost \$1.3 million and using in-situ groundwater treatment by seawater injection would cost \$1.5 million for 30 years. Given the uncertainty of whether these groundwater measures would be effective in cleaning up the aquifers, EPA has determined that it is appropriate to take the source control measures identified in the selected remedy and then evaluate what, if any, further groundwater cleanup activities are necessary.

83. COMMENT: One citizen expressed the opinion that the billions of dollars spent on the Superfund program in the U.S. is disgraceful and has shown very few results.

RESPONSE: EPA disagrees. Accomplishments under the Superfund program include performing thousands of short-term removal actions (e.g., responding to emergency spills, etc.), completing major cleanup construction activities at over 278 sites, and starting major cleanup activities at more than 430 sites.

84. COMMENT: One commentor expressed the view that millions of dollars have already been wasted trying to determine the best cleanup method for the Asarco Site.

RESPONSE: EPA and Asarco have spent significant time and money to determine the types and locations of contamination on the Site and how the Site can be cleaned up. These evaluations are necessary and worthwhile and will result in an efficient cleanup.

85. COMMENT: One commentor expressed the opinion that Asarco should have been responsibly setting aside money for cleanup every year since the Site was deemed to be part of a Superfund site. Another commentor stated that Asarco had a savings account for contamination cleanup in excess of \$150 million dollars.

RESPONSE: Asarco will be required to fund the amount necessary for cleanup of the Site. How Asarco chooses to pay for the cleanup is its own decision.

86. COMMENT: One citizen was dismayed at the amount of money Asarco was spending on its public relations campaign, stating that the money spent sending her leaflets, correspondence, and Christmas cards would be better spent on cleanup of the Asarco Site.

RESPONSE: EPA will not credit or deduct the amounts Asarco has spent on public relations campaigns from the amount it will be required to spend on cleanup.

2.12 PUBLIC INVOLVEMENT

87. COMMENT: Many commentors expressed the opinion that Asarco is trying to pressure the public into accepting the provisions of the "Agreement in Principle," including the less expensive on-site containment option, in exchange for development money. Two commentors suggested that Asarco has "bought off" the officials from Ruston, Tacoma, the Park Board, and other community agencies. Another commentor expressed frustration with Asarco's "carrot and stick" tactics to keep contamination on the Site and requested that EPA weigh-in on the side of the public when making decision. One of these commentors suggested that there will be a lot of alienation against the EPA if the OCF is not approved.

RESPONSE: EPA believes that the community participation in planning for the future development of Site was important and beneficial to the community. The local governments and

Asarco succeeded in providing many sessions for community members to express their point of view and then took their comments and used them to develop an overall design strategy for the project.

It appears that one reason Asarco spent a lot of time and money on the development project was in hopes that a less expensive cleanup option would be supported by the community. For the past 4-6 years elected representatives of the community had been strongly opposed to an OCF. During the land development sessions, the facilitators were able to understand what the objections and concerns were about on-site disposal and were able to design a preliminary development plan to address these objections and concerns.

Asarco's efforts were very public, as was the approval of the "Agreement in Principle," by the councils in Ruston and Tacoma, and the Park Districts' board. The local governments recommended to EPA that an OCF be selected. The charge that Asarco has "bought off" public officials is unfounded. During the public comment period, EPA received approximately 830 out of a total of 900 cards and letters of support for an OCF and future development. EPA shares the opinion of these commentators that an on-site containment facility can be constructed to protect human health and the environment.

Independent of the land use community participation sessions, EPA sponsored 2 public meeting and spoke at 10 meetings with local community groups such as the Rotary Club and the Environmental Commission of the Chamber of Commerce. The overwhelming message heard at all of these meetings was support for on-site disposal of soil and debris.

88. COMMENT: Several people commented that the EPA should make the best and safest cleanup decision possible, without public influence, pressure from the land use committee and/or development considerations. Some of these commentators suggested that the propaganda and development money offered by Asarco may be tainting the approach by the federal government to the cleanup and that EPA should keep these considerations separate from the cleanup decision. One commentator was disturbed by Asarco's seemingly "manipulative" pamphlet. Conversely, two commentators expressed the opinion that the EPA use a more democratic process to decide the cleanup method for the Asarco Site and give greater consideration to public opinion.

RESPONSE: Public comment on EPA's cleanup decision is an important part of the remedy selection process. In this case, EPA encouraged the land use process to occur prior to issuance of EPA's Proposed Plan in order for the agency to fully understand the needs of the community and not preclude future development options needlessly. Nonetheless, EPA's paramount concern is protection of human health and the environment, which will be achieved by the cleanup remedy that EPA has selected for the smelter site.

89. COMMENT: Several commentators commended Asarco, the municipalities, and the community for coming together to work on a major urban revitalization plan. Some commentators stated that this project is a demonstration of how EPA can work with the community to promote environmental remediation and economic development.

RESPONSE: Although we are not done yet, EPA is also pleased with the work the Land Use Group has completed and believes that working on Site cleanup together with future development of Superfund sites is an effective approach.

90. COMMENT: One citizen would like to know what she can do to help, and which politicians have expressed concern or provided assistance.

RESPONSE: There will be many opportunities for community involvement during the development of the environmental cleanup design work plans. EPA will send out Fact Sheets that describe ongoing work and also provide notice of opportunities for the public to participate. In addition, EPA anticipates that the Land Use/Development Group will continue to sponsor community sessions in order to refine the uses for the "development zones."

Many of the elected and appointed representatives of Ruston, Tacoma and the Park District have been involved in the land use and cleanup processes, such as:

Phil Parker, Mayor of Ruston
Charlene Hagen, Ruston Town Council
Ray Corpuz, City Manager of Tacoma
Paul Miller, Tacoma City Council
Jim Montgomerie, Metropolitan Park District

91. COMMENT: One person was dismayed by the course of events at the Pierce County Council meeting because she felt that the environmental aspects of the cleanup were not adequately addressed, only development and financial topics were discussed in detail. She also expressed the opinion that most of the people in the community are not adequately informed of EPA's cleanup proposal.

RESPONSE: EPA was not notified of the County Council meeting. EPA uses various ways to keep the public informed, such as Fact Sheets, public meetings, news ads, mailing lists, TAG Grants and information repositories. We are always open for any suggestions, so please let us know of your ideas. EPA believes that by the end of its 90-day public comment session and the Asarco Week #4 meetings that hundreds of local community members were aware of and had participated in the cleanup and planning decisions for this Site.

2.13 MISCELLANEOUS

92. COMMENT: One commentor believes that the following statement is not complete and does not address the other characteristics of dangerous wastes as defined in Washington State Dangerous Waste Regulations (WAC 173-303): "Waste that is not a federal hazardous waste but has the potential to migrate into the environment would be disposed in a solid waste landfill that meets state requirements (Page 23, Paragraph 5 of the Proposed Plan)." He asked if the Toxicity Characteristic Leaching Procedure (TCLP) is the only criterion that was used to make the determination.

RESPONSE: The statement in the Proposed Plan was intended to clarify that soils not regulated under federal law (e.g., treated soils that pass the TCLP test) may still need to be disposed in a landfill that met state solid waste landfill requirements. This determination would have been based on the results of water leaching tests showing that disposal of treated soil would not be protective of the environment. The state has specified its requirements for disposal of dangerous waste in WAC 173-303. The state's determination of "dangerous waste" can be based on metal concentration as well as TCLP leachate concentration.

EPA has selected the OCF, the untreated soils that will be disposed on site are a federal hazardous waste. Therefore, the OCF will meet both federal and state hazardous and dangerous waste requirements for landfills.

93. COMMENT: One person suggested that Asarco has profited at the expense of the environment because of the lack of environmental concern on behalf of the local governments. This commentor stated that the "Tacoma Aroma" is symbolic of the way the local governments have been dominated by industry. This commentor added the example of the local water treatment plant that has been in violation of EPA standards for years, however the city has chosen to pay the fine rather than remedy the problem.

RESPONSE: EPA encourages the commentor to express his/her views directly to the appropriate local governments.

94. COMMENT: Several commentors expressed the opinion that the EPA has done a good job in its development and presentation of the preferred alternative and Proposed Plan.

RESPONSE: EPA appreciates the comment.

95. COMMENT: Several public agencies, the Washington Department of Natural Resources, Citizens for a Healthy Bay, and the Puyallup Tribe commented that they would like to have greater involvement and input in the development and planning of the Preferred Alternative/Proposed Plan. Additionally, the Puyallup Tribe requested that EPA act in concert with Federal Indian Policy and consult with the tribe on whether the Proposed Plan is consistent with Environmental Justice policies.

RESPONSE: All of these organizations participated on the Coordinating Forum (local, state and federal representatives with an interest in the Asarco Smelter project) which was convened in July 1993. Policy makers and staff members from local government, local, state and federal health departments, and environmental representatives participated in all aspects of reviewing and commenting on the cleanup alternatives and future land use concepts. EPA will encourage these same organizations to participate in remedial design.

Consistent with EPA's Indian Polich, EPA's Regional Administrator met with representatives of the Puyallup Tribe on March 16, 1995, to consult on a government-to-government basis on all of the Tribes concerns. EPA believes that the Proposed Plan is consistent with its regional, Environmental Justice principles.

96. COMMENT: The Puyallup Tribe reiterated the Clinton Administration's policy that "people of color and the economically disenfranchised should not be forced to bear unfair environmental burdens" (Executive Order 12898, Federal Register 7629).

RESPONSE: EPA believes that the cleanup it has selected is fully in accordance with the objectives and requirements of Executive Order 12898.

97. COMMENT: Several commentors were troubled by the estimated time for completion of the cleanup. They believe that the cleanup action has taken too long already and/or that the cleanup process and consequent development should be expedited. Other commentors requested EPA to take time to carefully consider public comments and to make scientifically sound decisions.

RESPONSE: EPA has reviewed all of the comments received during the public comment period. It is EPA's intent to work with Asarco and the local municipalities so that cleanup activities can begin as soon as possible. One approach to ensure that Site cleanup will not be delayed is that when the Site is ready to be capped, even if all of the residential soils from the surrounding neighborhoods have not been removed, a cap will be installed and the Ruston/North Tacoma soils will be disposed in an appropriate off-site disposal facility, see Section 9.0 of the ROD.

98. COMMENT: One commentor expressed concern about the noise that the cleanup project would generate.

RESPONSE: Heavy equipment and machinery will be used during the cleanup but EPA will require Asarco to reduce the noise to the extent possible by limiting the work hours and selecting dedicated routes that trucks and traffic can use. Local residents and government will have an opportunity to participate in the development of these plans.

99. COMMENT: One commentor believed that the stack bricks would be removed after demolition, however was surprised to learn that they would only be covered with dirt.

RESPONSE: The stack bricks were covered with dirt after the stack was demolished in January 1993. However, the selected remedy calls for these bricks to be unburied and permanently disposed in the OCF.

100. COMMENT: The Puyallup Tribe commented that the nine criteria used to analyze the alternatives should not all be given equal weight. They stated that the protectiveness of human health and the environment and compliance with ARARs are the most important threshold criteria.

RESPONSE: Section 8.0 of the ROD explains how EPA evaluated the cleanup alternatives using the nine criteria. EPA emphasizes the importance of protectiveness and compliance with ARARs by designating them as "threshold criteria." This means that an alternative was not evaluated further if it did not meet these criteria.

101. COMMENT: One commentor expressed the opinion that, given the hazardous waste sites for which Asarco may also be responsible for in Montana and Colorado, Asarco is the fifth worst polluter in the country and possibly the world. This commentor also expressed the opinion that "Asarco's long-standing policy appears to be coverup and not cleanup."

RESPONSE: Asarco will be held responsible for cleaning up the former Asarco Tacoma smelter as well as other sites.

102. COMMENT: One commentor expressed the opinion that Asarco should have been forced to clean up and redevelop the Site years ago, and that Asarco has needlessly delayed clean up and redevelopment of the Site through endless litigation.

RESPONSE: Actually, to date there has not been litigation associated with the cleanup itself. Since 1986, EPA and Asarco have focused on the investigation of the Site, the analysis of potential cleanup alternatives, and the demolition of smelter buildings and structures.

103. COMMENT: One person commented that the cleanup method and development plan are irrelevant as long as his commute to work is not affected, and the new development is clean, legal, and profitable.

RESPONSE: EPA believes that the cleanup method and development plan are very relevant to the future of the community overall. EPA notes, however, that the community should expect that roads around the smelter may need to be closed during parts of the cleanup.

104. COMMENT: One commentor requested that the public comment period be extended past the October 11, 1994, deadline.

RESPONSE: The public comment period was extended to November 10, 1994, based on citizens' requests.

105. COMMENT: One commentor requested that interested parties be provided with a straightforward comparison between EPA's preferred alternative and the alternative proposed by the land use committee.

RESPONSE: The majority of the cleanup activities identified in EPA's selected cleanup remedy are also identified in Paragraph 7 of the "Agreement in Principle. However, EPA's selected remedy, see Section 9.0 of the ROD, provides more detail than the "Agreement in Principle" as to why many of the cleanup measures are necessary. Both the "Agreement in Principle" and the Selected Remedy require the cleanup to be protective of human health and the environment over the long term.

Common Elements of the "Agreement in Principle" and EPA's Preferred Alternative.

- Utilization of Ruston/North Tacoma residential soils as the sub-base for the plant and breakwater (slag peninsula) cap
- Monitoring and institutional controls
- Abandonment of the production well
- Installation of groundwater/surface water interceptor trenches
- Replacement of the existing drainage system, including outfalls
- Shoreline armoring

Additional Elements of EPA's Proposed Plan.

- Treatment of source area soils by solidification/stabilization and disposal as a sub-base to the site-wide cap
- Demolition of remaining buildings and structures
- Mitigation measures if wetlands or intertidal habitat are adversely impacted by cleanup activities
- Safety measures
- Integration of cleanup with land use plans

It should be noted that EPA's Selected Remedy in the Record of Decision selected disposal of soil without treatment in an OCF rather than soil treatment with solidification/stabilization. The "Agreement in Principle" also identified disposal of soil without treatment in an OCF. Other elements of the Selected Remedy are very similar to the elements in the Preferred Alternative described above.

106. COMMENT: One Metropolitan Park Board member commented that he did not sign the "Agreement in Principle" because he did not have the opportunity to fully analyze the situation and he was pressured, lied to, and threatened. He also stated that the Metropolitan Park Board has not agreed, passed, or discussed the "Agreement in Principle," nor have they authorized any

letters to be directed to EPA.

RESPONSE: EPA's understanding is that the Metropolitan Park Board did pass and sign the "Agreement in Principle" with all but one supporting vote. EPA suggests that this member talk directly with fellow Board members.

107. COMMENT: One commentor expressed the opinion that, based on the information on page 13 of EPA's Proposed Plan, it appears that all of the approaches are protective of public health and the environment and that it is difficult to determine which options are truly protective.

RESPONSE: On page 9 of the Proposed Plan, EPA provided all of the cleanup alternatives that were considered. On page 21, EPA explained that "the no-action alternatives are not protective of human health and the environment and thus were not further evaluated under the nine criteria." Otherwise, EPA believes that any of the remaining alternatives (other than monitoring and limited action) would have been protective of human health and the environment.

108. COMMENT: The Town of Ruston requested that EPA respect the permitting processes of the local governments (Ruston, Tacoma, Park District) and not preclude or usurp their authorities to require Asarco to obtain any and all infrastructure permits, and that these municipalities would like to review remediation plans.

RESPONSE: EPA agrees that it is important to work within the established permit processes of the local governments. EPA's expectation, however, is that these processes will not result in delays to cleanup activities.

3.0 ASARCO'S COMMENTS AND EPA RESPONSES

As part of an effort to obtain public comment regarding the Master Development Plan, Asarco distributed self-addressed, postage-paid comment cards to the public at several community meetings. Two different card types were distributed by Asarco during this effort, the first batch of cards were entitled, "Tell EPA what you think of the Asarco Land Use Plan," and included the statement, "I want the Asarco Site redeveloped," the second batch of cards were entitled "Tell EPA You Support the Asarco Master Development Plan," and included two statements to select from: "I support development of the Asarco Site and the on-site containment facility" and "I would like additional information about the plan and community meetings." Additional space was provided on both cards to include comments and the respondent's address/phone number.

A total of 673 comment cards were forwarded to EPA by Asarco during the public comment period. Based upon the type of comment card and the nature of the reply received, EPA has tallied and separated the cards into the five following general categories with regard to cleanup preference:

- 547 comment cards were marked in favor of the development of the Asarco Site including an on-site containment facility.
- 69 of the comment cards, respondents offered specific comments and suggestions for development of the Asarco Site, but not a preferred cleanup method.
- 24 of the comment cards, respondents indicated that they would like additional information and/or expressed specific questions, but did not state a cleanup preference. The questions have been summarized and responded to in Section 2.
- 19 respondents indicated that they were either opposed to the OCF or suggested a combination of on-site containment and treatment.
- 14 of the comment cards, respondents offered miscellaneous suggestions and comments, but did not indicate their cleanup preference.

EPA notes that many individual commentors sent their letters and "reply cards" directly to EPA and that most of these commentors also stated they were in favor of future development and an OCF.

In addition to comments received from citizens, local officials, and Natural Resource Trustees,

EPA received comments from Asarco, Inc., the Potentially Responsible Party for this site. The comments below summarize Asarco's overall concerns as well as its specific technical concerns with the Proposed Plan. As a member of the Land Use Group, Asarco did not support EPA's Preferred Alternative of soil treatment based on cost, long-term effectiveness and because it believes that treatment would preclude the implementation of future land development plans.

GENERAL COMMENTS

1. COMMENT: Asarco believes that although the cleanup decision is separate from the plans for future use of the Site, that the terms of the "Agreement In Principle" should be a significant factor to modify EPA's remedy when using the nine criteria analysis. Asarco believes that even if soil treatment and on-site containment facility (OCF) were "equal" with respect to the threshold and balancing criteria, that the community support for and on-site containment should compel EPA to select an OCF.

RESPONSE: As a modifying criteria, community acceptance, could result in EPA favoring a feasibility study that was otherwise equal with respect to all of the other threshold and balancing criteria. As stated in the Proposed Plan, EPA recognizes that in addition to cleaning up contamination at the Asarco Site, that the community is very interested in Site development as well. As a result, EPA received numerous comments from community members, community leaders and local businesses and groups supporting an OCF and future site development. It was these comments, in addition to the "Agreement in Principle," that convinced EPA that the selection of the OCF would be the best cleanup remedy.

2. COMMENT: Asarco stated that on-site containment meets both of the threshold criteria described in the "nine criteria:" (1) Protection of human health and the environment and (2) all Applicable and Relevant and Appropriate Requirements (ARARs) and on-site containment facilities (OCFs) have shown their effectiveness over the long term at sites throughout the country.

RESPONSE: EPA agrees that either soil treatment or on-site soil containment meet the two threshold criteria and that an OCF can be designed to be protective over the long-term.

3. COMMENT: Asarco stated that EPA's Proposed Plan is not "cost-effective," nor does it "utilize a permanent solution and alternate treatment technologies or resource recovery to the maximum extent practicable" which are two of five balancing criteria described in the "nine criteria." Asarco believes that cost-effectiveness is a "condition (emphasis added) for remedy selection, not merely a consideration during remedial design and implementation," (55 F. Reg. 8726), and that "cost-effectiveness" is based on the selected remedy's overall effectiveness which is described in § 300.430 (f)(1)(i)(B) of the National Contingency Plan (NCP) as long-term-effectiveness and permanence, reduction of toxicity, mobility, or volume through treatment, and short-term effectiveness.

RESPONSE: EPA has made a determination in the ROD that disposal in the OCF is the cost-effective remedy (see section 10.3 of the ROD). This determination is based on EPA's finding that disposal in an OCF is an effective approach for isolating soil and debris from the environment and because disposal in an OCF is estimated to cost nearly \$30 million less than treatment of soil. In addition, the community clearly stated that it believed that selecting an OCF would allow future development opportunities at the Site.

4. COMMENT: Asarco also stated that increased cost of treatment would not result in a commensurate decrease in risk at the Site.

RESPONSE: EPA believes that the primary issue raised by the choice between treatment and soil was not the reduction in risk, which would be comparable, but the ability to select a remedy that would remain protective over the long-term and be compatible with future plans for the Site.

5.COMMENT: In addition, Asarco identified several additional reasons why soil treatment should not be selected. These reasons are:

- there is no evaluation of the effectiveness of treatment over many years;
- the cost of treatment is prohibitively high (\$150/ton);
- the amount of additive required results in a low density product resulting in a significant increase in volume of treated material;
- the physical properties of the treated material raise implementability questions with respect to future plans for Site development; and
- the longer time for remediation would have serious negative effects on future land use plans.

RESPONSE: EPA's response is as follows:

(1) EPA agrees. Although as noted in Response No. 21 in Section A, landfills have also not been around for a significant number of years either. (2) The cost of treatment, re-evaluated in context of the responses received from the community, indicated that a less costly and equally protective cleanup was preferred. (3) Although it is not clear how/if the increased soil volume would have impacted Site development, EPA believes that this could have been factored into Site plans in the future. (4) EPA agrees that the appropriate places on the Site would have had to have been identified to ensure comparability of soil treatment with Site development. (5) EPA is not sure why Asarco believes that soil treatment would take longer than construction and filling an OCF. The Feasibility Study states that treatment would take 6 months and the OCF alternative could take up to 2 years.

6. COMMENT: The overwhelming community support for the "Agreement in Principle" should result in the selection of a containment alternative as the remedy and the NCP allows EPA to select an alternative favored by the community over an equally protective alternative.

RESPONSE: EPA has selected an OCF as part of its selected remedy, see Section 9.0 in the ROD.

7. COMMENT: The ROD should acknowledge the work currently being conducted under the Administrative Order on Consent which was signed by EPA and Asarco in 1994, and allows maximum future flexibility in any modifications to the current shoreline so that the uplands and marine remedial actions can be integrated in a reasonable and cost-effective manner. In addition, Asarco stated that CERCLA does not authorize EPA acting alone to impose habitat restoration or mitigation as part of a remedial action, but instead, states that restoration measures may be agreed upon by the PRP and the natural resource trustees.

RESPONSE: EPA acknowledges that sampling and analysis activities are being conducted under the 1994 AOC. Integration of the cleanup of sediments and cleanup of uplands portions of the Site is a worthwhile objective but is not a specific provision of the AOC. During the development of the work plans for Site cleanup, EPA will work in conjunction with Asarco, the natural resource trustees and the community to develop the necessary mitigation measures for the Site, see Section 9.0 of the ROD. EPA agrees that restoration measures (i.e., to compensate for past injuries to natural resources) will be determined by Asarco and the natural resource trustees.

8. COMMENT: The ROD should resolve the issue of the Ruston/North Tacoma Study Area residential soils disposal and should set performance standards, rather than numerical remediation goals, for groundwater monitoring.

RESPONSE: The selected remedy for the Ruston/North Tacoma residential soils is to place them beneath a cap (e.g., used as a sub-base) in areas that will not be impacted by groundwater, see Section 9.0 of the ROD. The ROD identifies measures to control the sources to groundwater (e.g., soil excavation, containment and capping and replacing the surface water drainage system) and monitors the effect of these activities. The Class III preliminary remediation goals will be used as bench marks to evaluate the impact of source control activities on groundwater that enters Commencement Bay.

9. COMMENT: There are some fundamental differences between EPA's preferred remedy and the remedial actions proposed as part of the Agreement in Principle. The primary differences involve how soil is handled after excavation from source areas.

RESPONSE: EPA has selected disposal of source area soil in an OCF in the Record of Decision.

10. COMMENT: Treatment of a portion of excavated soils, the arsenic kitchen soils for

example, would be prohibitively costly.

RESPONSE: EPA believes that treatment of any part of the excavated soils before disposal in an OCF would certainly add to the overall cost of the cleanup. Because several commenters recommended that some or all of the soils be treated before placing them in an OCF, EPA evaluated the environmental benefits of treatment. In this analysis, see Appendix D, EPA has determined that treatment of the most contaminated source area soils would not substantially decrease the potential impact on groundwater from leachate. EPA has not selected treatment of soils as part of the ROD.

11. COMMENT: Over 70 physical, chemical, biological and thermal treatment processes were examined for potential application for the smelter site. Among the technologies investigated for site specific applications for the site were soil washing, soil acid leaching, and soil fixation.

The studies showed that soil washing and/or leaching was not applicable for the site because of difficulties with physical and chemical conditions of site soils. Technical problems with soil leaching included incomplete removal of arsenic, failure of leached or washed materials to pass TCLP after treatment, and additional treatment requirements associated with acid fluid treatment and subsequent disposal.

Two commercial vendors were able to demonstrate, in the short term, attainment of treatment objective. However, projected treatment costs are high and considerably more expensive than other soil options including the use of an OCF.

RESPONSE: EPA believes that soil treatment by solidification/stabilization could be effective over the long-term. The additional studies conducted by Asarco indicate that the TCLP test results are slightly less effective after 28-day testing (but are still significantly below hazardous waste regulatory threshold levels for treatment) and that the volume of the treated material increased by approximately 60%. EPA did not select treatment, however, because soil can effectively be isolated in an OCF, the OCF was much less expensive than treatment, and because the majority of commenters supported disposal in an OCF in conjunction with land use plans.

SPECIFIC COMMENTS

All of the following comments from Asarco refer to EPA's Proposed Plan, dated August 10, 1994.

12. COMMENT: Page 4, fourth paragraph, first sentence. The sentence should read "surface water features on the smelter property include surface water in the cooling pond...." There is no longer surface water flow into the pond and surface water flow has been diverted around the cooling pond since Spring 1993.

RESPONSE: This comment has been incorporated into the "Background" section of the ROD and it now states that, "Surface water features on the smelter property include surface water in the cooling pond..."

13. COMMENT: Page 5, legend to Figure. "known sources" should be changed to "identified source areas"

RESPONSE: The clarification has been made in revised Figure 1-1.

14. COMMENT: Page 6, first paragraph, last sentence. The remedial investigation identified six areas as source areas of arsenic and metal concentrations to groundwater, based primarily on the association of these areas with elevated concentrations in groundwater. Of these areas, the arsenic kitchen and the southeast plant area have subsurface soil data that support the hypothesis that these areas contribute arsenic and metals to groundwater. The stack hill contributes arsenic and metals to surface water where groundwater "daylights" through soils that contain elevated arsenic and metals. Available soil and water data from the cooling pond suggest there are little impacts to groundwater, from this source; however, the pond is considered a source area because of its total sediment arsenic and metal concentrations and because of its historic use as a process water pond that stored water containing elevated arsenic and metals. The remaining areas (copper refinery area and fine ore bins area) are assumed groundwater

sources primarily because of their association with elevated groundwater concentrations and known history of these facilities. Soils in these areas were assumed to be sources to groundwater for feasibility study purposes; however, insufficient data are available to positively establish soils from these areas as groundwater arsenic and metal sources.

The sentence would be more representative of actual site conditions if it read "These are areas that appear to act as the primary sources".

RESPONSE: The ROD states that, "These are areas that have either the highest measured concentrations of contaminants in the soils, appear to act as the primary known sources of contamination to groundwater and surface water, and/or have large amounts of contaminated material based upon the historic uses of these areas."

15. COMMENT: Page 6, second paragraph, first sentence. The first sentence is not true. First, the areas have not been identified based on the presence of the "highest known concentrations" but, instead, based on their association with highest groundwater concentrations of arsenic and metals. In some cases, such as the arsenic kitchens and stack hill areas, these areas do contain some of the highest total soil metal concentrations, but, more importantly, also the highest leachate soil concentrations. However, some of the identified source areas are not associated with confirmed total soil data. For example, to date the soil quality underneath the fine ore building has not been tested. Second, not all metals and/or organic chemicals are "highly mobile and leaching out of soils or slag." The sentence should be changed from "...which are highly mobile and are leaching out of soils or slag..." to "...which may be leaching out of soils or slag..." Also, the suggestion that high metal values automatically result in principal threats to groundwater is not correct. High metal values in themselves are not an indication of a threat to groundwater, as demonstrated by slag. The threat to groundwater is determined by leachability and subsequent mobility of a chemical.

RESPONSE: See response to Comment No. 14.

16. COMMENT: Page 6, fourth paragraph, last sentence. The statement that, "Most of the slag portions of the Site appear to contribute less contamination... as compared to the source areas..." is incorrect. All slag contributes less than the source areas. However, this effect can be obscured by other sources, such as is the case for the slag located in the plume down-gradient from the arsenic kitchen. It would be representative of actual conditions if this sentence was changed to read: "Slag appears to contribute less metals to groundwater...as compared to the source areas..."

RESPONSE: The ROD states that, "The slag portions of the Site appear to contribute less contamination to groundwater as compared to the source areas described."

17. COMMENT: Page 6, sixth paragraph, second sentence. It is not certain pipes are filled with sediment or that they are cracked. Because of the age of the plant, an assumption was made in the FS that drainage lines were cracked and that sediment in pipes was possible. A suggested change to the sentence is "pipes may be cracked and/or contain contaminated sediment."

RESPONSE: The ROD states that, "The pipes and drains associated with the system may be cracked and/or the pipes filled with contaminated sediments."

18. COMMENT: Page 6, ninth paragraph, last two sentences. Based on site data, it is apparent that smelter site groundwater arsenic and metals are more affected by low redox conditions associated with the presence of organic material than by resultant pH conditions. The presence of seawater apparently buffers groundwater in the southeast plant area and pH concentrations are typically above 8 indicating acidic conditions at this location are not occurring.

RESPONSE: The language in the ROD is revised to read that wood waste buried in the slag is decomposing, thus contributing to the release of metals, particularly arsenic, from the slag.

19. COMMENT: Page 6, last paragraph, first sentence. The metal levels in groundwater do more than just "appear" to decrease as groundwater moves toward the bay; the data indicate that this decrease is a fact. We suggest changing this sentence to read; "The metal levels in groundwater decrease as groundwater moves through smelter property toward Commencement Bay".

Although the cause of the decrease remains a subject of debate, as pointed out by the description of potential causes in the following sentence, the metals levels decrease is documented by validated data.

RESPONSE: The ROD states that, "The metal levels in groundwater decrease as groundwater moves through the smelter property towards Commencement Bay." EPA agrees that the reason(s) why this decrease occurs has not yet been established.

20. COMMENT: Page 7, first paragraph, last sentence. No large cracks as described in the proposed plan have been identified during the RI/FS. The crack hypothesis is entirely of regulatory origin. Although one well had a higher test permeability than surrounding wells, the significance of the well test relative to groundwater metal transport is not clear. All available evidence indicates that dilution and/or adsorption are occurring to the same degree in the central portion of the site. If anything, dilution and/or adsorption are probably most effective in the central portion of the site, as evidenced by the substantial decrease in metals concentrations over relatively short distances.

RESPONSE: This sentence was not included in the ROD.

21. COMMENT: Page 7, EPA's Cleanup Objectives, first sentence, cleanup actions necessary because of "long-term cancer risks for workers". Long-term cancer risks to sealife and animals were not evaluated as the sentence implies.

RESPONSE: Risks to sealife and animals were qualitatively evaluated in EPA's ecological risk assessment. EPA's conclusion was that sealife has been adversely impacted by releases from the Site and that the Site posed risks to terrestrial animals and vegetation.

22. COMMENT: Page 8, Contaminated Soil Dust and Slag, Objective c, "Prevent the erosion of slag to the off-shore sediments". Existing data suggest the significance of slag erosion is highly overestimated in the Proposed Plan. Although slag contains elevated concentrations of total metals, available data show in the marine environment, slag and sediment that contain slag have a very low leachability. In addition, no detrimental effects of slag on sea life have been documented. In fact, the off-shore community at the smelter is viable and healthy. Slag has been used on the plant site and on the Yacht Club breakwater because its physical properties (coarse grain size and massive texture) made the material an ideal medium for shoreline armoring construction. Armoring of the slag would be primarily cosmetic with little, if any, benefit to the marine environment. While slag armoring could provide a habitat niche for marine life, installation of armoring will, at least temporarily, adversely affect presently established communities.

RESPONSE: EPA believes that slag is eroding to some degree, and therefore exposing faces that leach metals more readily than weathered faces. As part of the remedial design, EPA will require that additional studies are conducted to indicate which part of the slag shoreline is eroding and where shoreline armoring should be placed.

23. COMMENT: Page 11, Shoreline Armoring. This section appears to begin with the premise that shoreline erosion is a substantive issue. Although shoreline armoring was among alternatives evaluated in the FS, to date no information has been produced to document that shoreline erosion is a substantial source of slag to the marine sediments of Commencement Bay.

This question is raised for two reasons. Slag was directly placed in Commencement Bay and its sediments by disposal actions over a 75-year period. Visually obvious erosion could only account for a very small fraction of the slag present in Commencement Bay sediments.

Erosion is visually obvious at some locations along the slag peninsula and smelter property. However, many portions of this area show no obvious evidence of erosion. This raises the question of whether rumoring the total shoreline is appropriate, or if armoring is at all appropriate?

It is also reasonable to question whether slag erosion is causing any environmental other than those produced by physical erosion of natural substrates. The study of freshly cut slag by Battelle (Crecelius, 1966) showed that marine larvae settle as rapidly on slag as on basalt rock and concrete. Although this study showed metals are released from freshly cut slag for three to

four months, this brief period would produce very minor contributions of metals to Commencement Bay waters or sediments at the visually apparent erosion rates.

The EPA discussion assumes that a 5 foot thick layer of riprap over a 2 foot layer of small rock is necessary, to prevent erosion. Although total armoring for the shoreline was assumed in alternatives presented in the FS, it will be necessary to conduct an engineering analysis of shore processes along the smelter property and slag peninsula to determine what design is most appropriate, as well as if and where protection might be required.

The existing slope along the north portion of the bayward face of the slag peninsula may be too steep to make armoring practical without major shoreline modification. The steep slope at the north end of the Yacht Club breakwater extends to great depths (at least to 200 feet) indicating that major dredging or cut back at this location may be required to establish a foundation for shoreline monitoring.

Combined plant site and breakwater shoreline armoring costs would be \$6.2 million dollars based on assumptions presented in the FS and cost projections presented in the Proposed Plan. This expense would be incurred for primarily cosmetic alterations to the shoreline and provide little environmental benefit. In fact, shoreline armoring will have a significant impact on diverse and apparently healthy communities already established in shoreline slag.

RESPONSE: EPA agrees that additional engineering studies are necessary to determine the extent of shoreline armoring that will be needed in areas that are eroding. EPA does not believe that shoreline armoring will be conducted for cosmetic purposes only, but will be placed in those areas which pose a threat to the offshore environment.

24. COMMENT: Page 14, Plant Site Soils, 1c. It should be noted that, in many cases, sampling results will not determine the feasible extent of excavation, but will provide documentation on post-excavation conditions. Excavation in some areas, particularly in the fine ore bins area and the copper refinery areas, will be limited by equipment capabilities, and by limitations association with high water table and high permeability conditions.

RESPONSE: EPA recognizes that some materials in the source areas will not be able to be excavated, see "implementability" in Section 8.0. In addition, Asarco will be required to confirm that all necessary source area excavation, as practicable, has been performed.

25. COMMENT: Page 14, Plant Site Soils, 1d. In addition to demolition materials, some soil contains coarse grained fractions that are greater than 2 inches in size. During pilot scale testing, these sizes were simply screened out and were not treated. If treatment were to be implemented on a large scale, these fractions would either have to be ground to a finer size for incorporation in the treatment process, or dispose with demolition debris. Either action involves an increase of material handling, processing and costs over those associated with the soil fixation process activities demonstrated during the pilot scale tests.

RESPONSE: EPA understands that there may be some additional costs associated with a full-scale treatment project. However, treatment has not been selected in this ROD for this Site.

26. COMMENT: Page 14, Plant Site Soils, 1e. Removal of the car tunnel was not included in the primary remedial action scenarios evaluated during the FS and this action is not included in the Proposed Plan cost estimates. The FS assumed removal of the car tunnel and railroad tunnels as available options and responsibilities of the owners: Tacoma/Ruston, and Burlington Northern railroad, respectively. Since the tunnel is associated with seeps that have poor water quality, it is possible that concrete from the tunnel, if removed, would require disposal as a hazardous waste. It is estimated that removal of the tunnel, including demolition costs, would increase present cost estimates as high as \$2.2 million. Filling the tunnel may be more cost effective than demolition and removal. In addition, the car tunnel is part of a unit construction with the rail tunnel which would be impacted by removal of the car tunnel portion of the structure.

RESPONSE: The determination of whether the tunnel is removed or filled in will be made during the design phase of the project. As noted in Section 9.0 of the ROD, the OCF will be designed to allow for a limited amount of additional capacity in the event there is more than the estimated 160,000 cubic yards of soil and more than the estimated 80,000 cubic yards of

27. COMMENT: Page 15, 3a, use of fabric as marker. A marker would not be necessary for most of the plant site to identify the base of an imported soil cap. The presence of slag which has a very dark color and coarse grained texture that would be significantly different in color and texture from fill, and topsoil imported to the site would provide easy identification when the base of the cap was penetrated. In addition, remaining man-made features such as concrete slabs, foundation or pavement would also easily be identified at the base of the cap.

Ruston soils would also easily be identified. These soils will be incorporated under a drainage gravel layer which is, in turn, underlain by a clay layer. These distinctly different soil types would be easily identified and would mark the locations of the base of imported topsoil as well as the top of underlying Ruston residential soils.

RESPONSE: EPA agrees that a visual marker will not be necessary since the clay layer will serve this function as clay will be located above the slag, building pads and foundations and the Ruston/North Tacoma residential soils.

Asarco is incorrect in stating that the clay layer will underlie the residential soils. The residential soils will be used as a sub-base below the clay on the Site cap. Residential soils can be placed in areas of the site not likely to be impacted by groundwater.

28. COMMENT: Page 16, Figure 3 (in Proposed Plan), Hazardous Waste On-Site Containment Facility (OCF). The figure is not correct. The part of the cover that includes a 1 foot layer, which underlies the filter material, would not consist of compacted soil as shown in the figure but, instead, would consist of a drainage layer.

RESPONSE: In the cap, beneath the one foot of drainage material, there will be a fabric liner and two feet of compacted soil above the waste material, see Figure 7-2.

29. Page 18, Surface Water, second paragraph, last sentence. As noted several times in the FS, large scale treatment of surface water to consistently meet low standards with arsenic and metal marine criteria may not be technically feasible. This is particularly true for the relatively large flows (200 gpm or greater) associated with surface water discharge from drainage areas above the plant site.

RESPONSE: EPA will evaluate the need for, and the feasibility of, surface water treatment after the source control activities in the ROD are completed.

30. COMMENT: Page 18, Shore Line Armoring of the plant site and slag peninsula. "One goal for the shoreline would be to restore aquatic habitat that would benefit eelgrass salmon and other marine life. Methods may include shoreline pull back and sloping, development of pocket beaches, mudflats, vegetated shallows, and shoreline irregularity. There is no evidence that shoreline armoring would provide any aquatic habitat more suitable for marine biota than the existing slag surfaces. The armoring might provide less suitable habitat because of the loss of physical irregularities that the slag provides. Rock riprap provides a generally even, flat surface inhabited by fewer species and number of organisms than the highly irregular surfaces of slag.

Neither slag nor shoreline armoring provide a suitable habitat for eelgrass. Shallow water wave energies that require hard substrates (armoring) prevent eelgrass growth. Eelgrass also requires slit to sand-gravel substrates, not hard surfaces. Salmon and other sea life are capable of using the existing slag habitat, and are unlikely to benefit from shoreline armoring.

Development of pocket beaches, mudflats, shoreline pullback, etc., goes far beyond shoreline armoring. These actions would require great modification of the existing conditions and would result in environmental and economic costs far greater than traditional shoreline armoring as presented in the Feasibility Study. Existing features that have present or potential future economic or environmental value such as the off-shore piers may not survive modifications associated with modifications of features as discussed in EPA's plan. The additional economic costs are not factored in the costs presented in the FS or in the Proposed Plan. Preliminary estimates to include features described in the Proposed Plan as part of shoreline armoring

indicate costs would be increased \$9 million to \$9 million above the \$6.25 million presented in the Proposed Plan for plant site and shoreline armoring costs. Since, as noted above, the area is by nature not suited for many of features such as mudflats, eelgrass, and pocket beaches, as well as shoreline cut backs would involve significant alteration to existing conditions. For instance, off-shore features such as breakwaters would probably be necessary to encourage fine-grained environments that maintain features such as mudflats and eelgrass. Presently not possible in the relatively fast moving coarse grained deposition environment typical to not only the Asarco Site but the adjacent gravel beach areas outside the plant site off-shore area. Obviously, implementation of features that require such an alteration of existing conditions would require considerable study as part of preliminary remedial design efforts.

RESPONSE: The riprap itself is not expected to provide a more suitable habitat than the slag; however, the armoring can be designed to have ledges or irregularities that are more supportive of marine biota than the slag. These areas could be constructed with gravel and on a more gentle slope than the slope of the present Site. A habitat conducive to epibenthic species (organisms living on the sea floor) could be created, which would, in turn, be beneficial to salmon.

EPA agrees that low-energy habitats would not likely persist along the Asarco shoreline. However, a moderately active environment, such as a gravelly/sandy area conducive to other types of aquatic species, may be able to be created off the Asarco Site. Although on-site mitigation is a preference, a habitat that is conducive to eelgrass could be created as part of an off-site mitigation effort.

EPA agrees that reducing the effects of the currents on the exposed face of the Asarco Site would require extensive effort, including the use of groins or breakwaters. These costs, which would be weighed against their benefits, are not part of the shoreline armoring costs in the FS, but rather can be part of the mitigation costs since they would benefit the mitigation efforts. These costs could also be weighed against their overall benefit and/or be compared to other mitigation efforts with similar costs.

Shoreline pullback, sloping, and shoreline irregularity are possible at the Site and can be part of the shoreline armoring and/or mitigation efforts. For example, shoreline armoring, which is intended to reduce the erosion of slag, can be accomplished adjacent to an area that is cut back and less shallow, which could be intended as part of a mitigation site. The most appropriate habitats (e.g., those with the greatest chance of persistence) would then be chosen for these various post-remediation environments. The associated costs could be part of the shoreline armoring costs and the mitigation costs.

EPA will consider the existing futures on-site end the planned uses of the site in the remedial design stage so as to ensure compatibility.

EPA acknowledges that much more about the sediments site will be learned from the ongoing and upcoming expanded RI/FS activities, including a better understanding of the amount of erosion at the site and potential disposal and mitigation sites.

31. COMMENT: Page 18, Shoreline armoring of the plant site and slag peninsula. "Further, since armoring would adversely impact intertidal habitat of the shoreline, mitigation and/or restoration measures would be necessary." The admission that adverse impact to intertidal habitat would occur is evidence that the existing habitat has substantial production and ecological value. Mitigation would apparently be required because this production habitat would be degraded by shoreline armoring. Why conduct armoring unless the habitat would be degraded by shoreline armoring. Why conduct armoring unless the habitat is to be improved by this action? If it is improved, why require mitigation; isn't the action mitigation? Off-shore ecological impacts were noted in the FS evaluation as well as in the EPA Proposed Plan. As off-shore studies by Parametrix have shown, the area contains a diverse and productive environment that is essentially the same as other coarse grained bottom areas that are not located near or potentially impacted by existing or past smelter activities.

RESPONSE: EPA disagrees. EPA acknowledges that there is intertidal habitat that currently occupies the slag face at the Site; however, sampling activities on the off-shore sediment site provide evidence of adverse biological effects. The present expanded RI/FS activities at the sediments site will help quantify the harmful effects at the site with respect to the present

communities and allow EPA to balance the benefits of armoring compared to the impacts to existing habitat caused by armoring. EPA agrees that replacing one community with a similar community is not a beneficial use of funds; however, if the present off-shore biological community is shown to be impacted, a replacement community and/or mitigation effort may be warranted.

32. COMMENT: Page 18, Item (9), Safety Measures, lining and covering truck beds. Lining and covering truck beds probably would not be necessary for on-site activities. Excavation in areas such as the arsenic kitchen area, the copper refinery area, or the fine ore bins would not require such precautions. However, it is noted transportation across public roads from areas such as the stack hill or the cooling pond may require some of the safety precautions described in the Proposed Plan.

RESPONSE: If trucks are just moving from one location to another on-site, lining truck beds would probably not be necessary. But lining of truck beds, and other safety measures, will be required for transportation of waste off-site.

33. COMMENT: Page 19, Item 10 (b), guidelines to ensure disposal of dredged sediments would not be preventative or hindered by development activities. Although an OCF could be designed to hold shoreline sediment, additional steps, may have not been completely evaluated, would be necessary to ensure compatibility with incorporation into the OCF. Contrary to the sediment handling procedures anticipated with either use on an OCF or treatment, off shore sediments would have to be dewatered, with subsequent disposal and/or treatment of the decant water. If incorporated into a treatment option for "upland" soils, marine sediments themselves would not require treatment as all testing indicates the leaching potential is very low and most samples had leachable metal concentrations less than analytical limits. However, a key issue would be the increase in size of the OCF "foot print" to hold marine sediments and the resulting loss of available land area available for development. Vertical expansion limited by physical constraints, as well as constraints imposed by proposed road development and aesthetics and an increase of the "foot print" would be necessary. In addition to land needed for a larger foot print, more land area will be needed, at least temporarily, for sediment dewatering during construction, which would also complicate remediation and development logistics.

RESPONSE: EPA has decided not to dispose dredged sediments in the OCF. See the response to Comment No. 28 in Section A above.

34. COMMENT: Page 21, Shoreline Armoring: "Shoreline armoring under the Preferred Alternative is protective because it controls the erosion of the slag shoreline into Commencement Bay". It has not been demonstrated that all or most of the slag shoreline is eroding into the bay or that slag erosion is detrimental to the biological production at the smelter shoreline or slag peninsula.

RESPONSE: See the responses to Comment No. 43 in Section A above and Comment No. 22 in this Section.

35. COMMENT: Page 22, Surface Water "EPA believes that it may be appropriate to establish mixing zone when establishing discharge limitations for surface water". Asarco concurs a mixing zone would be appropriate.

RESPONSE: The language on mixing zone is included in the ROD, see Section 9.9. regarding performance standards for surface water. The determination whether a mixing zone is appropriate and, if so, the parameters of the mixing zone will be made during remedial design.

36. COMMENT: Page 22, Mitigation/Restoration. The Proposed Plan states that mitigation and restoration would be necessary to compensate for "impacts to wetlands" during the cleanup. It is not clear which areas of the site EPA considers to be wetlands. During discussions about remediation of the site, some, parties have taken the position that any alternative which contemplates filling the cooling pond would need to comply with mitigation standards under section 404 of the Clean Water Act. However, the cooling pond is not a wetlands within the definition of "waters of the United States." and section 404 requirements do not apply to its modification during remediation. The Asarco pond was part of a waste treatment system and qualifies for the specific exemption for treatment ponds in 33 CFR §328.3 (a)(7). Consequently, to the extent that there may be other regulated wetlands on the site, the specific areas of the

site involved should be specifically identified and should exclude the cooling pond.

RESPONSE: EPA agrees with Asarco's interpretation regulations that the cooling pond is not a wetland. Other areas of the Site, however, may be wetlands. A wetlands assessment will be required on the Site before remedial activities begin. If any wetlands are identified that will be adversely impacted by remedial activities, the appropriate mitigation measures will be required.

37. COMMENT: Page 24, Surface Water, last sentence referring to surface water treatment relative to long-term effectiveness and permanence. The long-term effectiveness of surface water treatment is questionable if large volumes are necessary to treat and discharge standards are extremely low. Volume control would be key to successful implementation. Treatment would be an on-going operation that would require periodic and relatively consistent maintenance. However, if lines are completely replaced and a design cap is implemented as proposed by EPA, surface water treatment should not be necessary to address sources from the plant site. In effect the treatment plant as proposed by EPA would be addressing off-site sources of arsenic and metals.

RESPONSE: EPA agrees that replacing the surface water drainage system should eliminate the need for surface water treatment. After cleanup activities under the ROD are completed, EPA will determine whether surface water discharging into the bay meets the remediation goals (see Section 9.9 of the ROD).

38. COMMENT: Page 24, Shoreline Armoring, Preferred Alternative, large rock and boulder riprap instead of artificial beach nourishment as riprap has a better potential to withstand current and wave action and remain in place compare to using smaller pebbles under the artificial beach nourishment option." Contrary to EPA's position, coastal engineering and design experts often promote beach nourishment over riprap structures. The Army Corps of Engineers and others prefer, in many cases, to use beach nourishment because it can provide better erosion/deposition control, than riprap design (Mark Lorane, Applied Coastal Science Inc., personal communication). This is particularly true where a potential exists for riprap structures to result in changes in wave and current patterns which result in unexpected and/or uncontrolled erosion or deposition in adjacent unmodified areas.

RESPONSE: EPA recognizes that riprap structures should be constructed only when necessary, and erosion from water flowing around the ends of the slope protection (e.g., breakwater) can cause erosion. The slope protection can be constructed in order to minimize this type of erosion. The design characteristics for the Asarco Site, including the hole of beach nourishment versus riprap structures, can be determined during remedial design, when there is a better understanding of the wave action and current energy at the site.

39. COMMENT: Page 25, Shoreline Armoring, "Slag pieces cause adverse impacts to sea life in offshore sediments." Adverse impacts of slag pieces to sea life have not been demonstrated by EPA's own admission.

RESPONSE: EPA disagrees. A report published by Battelle (Crecelius, 1986) concluded that metals released from freshly exposed slag are toxic to marine organisms for up to three to four months. Also, one of the objectives of the expanded sediments RI/FS is to evaluate whether slag pieces deposited in marine sediments are causing adverse impacts in the marine environment.

40. COMMENT: Page 26, Interception Trench Costs. These costs should be rounded to be consistent with other figures presented in this section.

RESPONSE: These numbers were rounded. See Table 8-2 in Section 8.0 of the ROD.

41. COMMENT: Page 27, Surface Water Costs. On Page 24, EPA states use of surface water treatment if necessary for plant site runoff surface water treatment costs are not presented in the Proposed Plan. The FS presented surface water treatment costs for all anticipated run-on to the site at \$23,600,000, present value. EPA's proposal would only address treatment after replacement of the present drainage system and implementation of diversions as necessary. Assuming the majority of runoff is diverted, the EPA proposal could require treatment of some undetermined volume. Even modest volumes of water (50 to 100 gpm) requiring arsenic and metal treatment would result in a significant amount of costs not presented in the plan. Asarco's

experience at the East Heredia Superfund site, where a treatment plant was installed to address plant water gains of about 50 gpm, shows costs to treat constituents similar to those at the Tacoma site are about \$7,000,000. However, if outfall drainage lines are completely replaced and a design cap is implemented as proposed by EPA, surface water treatment should not be necessary to address sources from the plant site. The treatment plant as proposed by EPA in effect would be addressing off-site sources of arsenic and metals.

RESPONSE: The need for, and feasibility of, surface water treatment will be evaluated should source control activities not attain performance standards for surface water.

42. COMMENT: Page 27, Shoreline Armoring Costs. Assuming riprap shoreline armoring costs as presented in the FS, the costs presented in the Proposed Plan are consistent with the FS. However, the costs do not reflect features discussed in the plan including pocket beaches, mudflats, eel grass, cut backs etc. Preliminary cost projections incorporating features as described in the Proposed Plan indicate shoreline armoring costs could increase \$6 million to \$9 million over the cost presented in the Proposed Plan. Four scenarios were considered:

1. Armoring as presented in the proposed plan.
2. Armoring assuming no encroachment in the bay and cut backs are necessary prior to riprap installation.
3. Shoreline armoring with advancing slopes and groins, and silt/sand fills needed to create vegetated shallows, pocket beaches and shoreline irregularities for aquatic habitat development.
4. Same as Scenario 3 but all cut backs and no advancing features.

While it is assumed for cost estimation purposes that features described in the four scenarios above could be implemented, it is far from certain incorporation of these features is technically feasible. A summary of preliminary cost estimates for the armoring scenarios is presented below:

Proposed Plan Costs #1	Capital	O&M	Present Worth
Plant site and breakwater	5.9 million	\$23,000	\$6.2 million
Scenario #2	Capital	O&M	Present Worth
Plant site and breaker	\$8-6 million	\$24,000	\$9.0 million
Scenario #3	Capital	O&M	Present Worth
Plant site and breakwater	\$11.9 million	\$48,000	\$12.6 million
Scenario #4	Capital	O&M	Present Worth
Plant site and breakwater	\$14.6 million	\$48,000	\$15.4 million

RESPONSE: The costs associated with mitigation activities will be in addition to the shoreline armoring costs. Mitigation costs can vary significantly, depending on the location of the site, the necessary preparation activities, and size of the site. Because EPA does not yet know the extent to which shoreline armoring will be required, EPA is not estimating the potential cost of mitigation.

43. COMMENT: Page 27, Institutional Controls. The \$500,000 under the O & M (annual) column should be moved to the Present Worth column

RESPONSE: This amount has been moved, see Table 8-2 in Section 8.0 of the ROD.

44. COMMENT: Page 27, Plant Site Excavation Costs. The excavation or demolition costs

presented do not include removal or filling of the car tunnel. As explained in the FS, this option was presumed to be the responsibility of the owner. Removal of the tunnel would increase costs an estimated \$2.2 million.

RESPONSE: In Paragraph 4 of the Agreement in Principle, Asarco agreed to remove or fill the car tunnel. EPA believes the approach to be used should be decided during remedial design.

45. COMMENT: Page 29, first column - last sentence continuing to the second column. This sentence is not comprehensible and needs revision.

RESPONSE: EPA corrected the error in subsequent editions of the Proposed Plan.

46. COMMENT: Page 30, (1) Statutory Findings, "cost-effectiveness." Asarco does not concur that soil treatment is cost effective compared to other equally protective alternatives such as containment in an OCF. EPA's preferred alternative is almost \$30 million higher than that proposed in the Agreement in Principle between Ruston, Tacoma, the Metropolitan Park District and Asarco.

RESPONSE: EPA has determined in the ROD that disposal of soil and debris in an OCF is a cost-effective cleanup action.

**TABLE B-2. LIST OF FACT SHEETS AND BROCHURES FOR THE
ASARCO TACOMA SMELTER SITE**

Date	Topic(s)
9/86	Fact sheet announcing an AOC between EPA and Asarco for an RI/FS, site stabilization, and an announcement of a public meeting.
10/86	Fact sheet announced a public meeting on November 6, 1986, for concerned citizens to hear about the results of the exposure pathways study for the Asarco Smelter.
4/87	Status Report published.
8/87	Status Report published.
3/88	Status Report published.
5/88	Status Report published.
7/88	Superfund update on the Asarco project.
8/88	Status Report published.
12/16/88	Fact sheet announced that EPA was to study arsenic contamination in the Ruston area, evaluate who might be at risk, and decide what actions need to be taken.
4/27/89	Fact sheet provided a status report of the smelter site RI/FS.
5/11/89	Fact sheet announced that EPA received the proposed work plan from Asarco for demolition of the structures and of the smelter stack.
7/14/89	Fact sheet requested Asarco to conduct the investigation to determine the extent of contamination at the smelter.
9/89	Update of all Superfund projects in Tacoma including information on the Asarco Smelter, and EPA's invitation to residents to join a community workgroup.
2/90	Update of all Superfund projects in Tacoma including a status report on the Asarco Smelter.
5/8/90	Fact sheet announced a Notice of Violation issued to Asarco by EPA.
7/16/90	Fact sheet announced the public meeting and comment period for the proposed plan for the initial site cleanup.
8/90	Update of all Superfund projects in Tacoma including a status report on Asarco.
1/14/91	Fact sheet announced the plan for the interim cleanup measures. This was the first ROD for the site.

**TABLE B-2. LIST OF FACT SHEETS AND BROCHURES FOR THE
ASARCO TACOMA SMELTER SITE (Continued)**

Date	Topic(s)
2/13/91	Update of all Superfund projects in Tacoma including the Asarco Smelter cleanup measures. This fact sheet also included information on EPA's Community Workgroup and community interviews which were underway.
5/6/1991	Fact sheet provided an update of all of the Asarco Superfund projects including the status of the smelter investigation.
8/6/91	Update of all Superfund projects in Tacoma including the Asarco Smelter interim measures (demolition) and the overall site investigation which now includes Asarco sediments.
10/91	Brochure describing all of the Superfund activities related to the Asarco Smelter including; the Ruston North Tacoma Study Area, the smelter site investigation and demolition, and marine sediments.
1/9/92	Fact sheet announced the public meeting and comment period on EPA and Asarco's efforts to demolish structures on the site, including the smelter stack.
3/92	Update of all Superfund projects in Tacoma including the status of the smelter demolition, disposal of the debris, collecting surface water on the site, implementing controls to reduce the amount of surface water entering the site, and an overall site investigation.
7/14/92	Fact sheet updated all of the Asarco Superfund projects.
11/92	Update of all Superfund projects in Tacoma including a status report on the Asarco smelter.
1/11/93	Fact sheet updated all of the Asarco Superfund projects.
6/93	Update on all Superfund projects in Tacoma including the smelter demolition and the overall site investigation.
9/22/93	Fact sheet announced the availability of the RI/FS and Risk Assessment reports for the site.
1/24/94	Update on the hazardous waste cleanup project. EPA integrated the smelter facility and the slag peninsula cleanup activities with the cleanup for the off-shore sediments project.
3/94	Brochure (revision of 10/91 version) describing all of the Superfund activities related to the Asarco Smelter including; the Ruston North Tacoma Study Area, the smelter site investigation and demolition, and marine sediments. This brochure continues to be available to members of the community upon request, and is provided as a handout at all of EPA's public forums.

TABLE B-2. LIST OF FACT SHEETS AND BROCHURES FOR THE
ASARCO TACOMA SMELTER SITE (Continued)

Date	Topic(s)
4/28/94	Fact sheet described a field test of a soil treatment technology, which was being considered for the Asarco Site.
8/94	Update on the hazardous waste cleanup projects in Tacoma, including the Asarco demolition activities and the smelter cleanup.
8/12/94	Summary of EPA's Proposed Plan, announcement of public comment period and public meetings.
10/5/94	Fact sheet announced EPA's proposal to allow slag to be moved from Thorne Road to the Asarco Smelter site. Public comments were invited from October 6 to November 4, 1994.
11/21/94	Fact sheet announced Asarco was moving the slag from Thorne Road in the Tacoma tideflats to the former Asarco Smelter in Ruston.
12/29/94	Fact sheet announced that all buildings slated for removal have been demolished and hazardous waste is being stored in the Fine Ore Bins building.

 B1 - Probable Human Carcinogen, limited human data available.
 B2 - Probable Human Carcinogen, sufficient evidence in animals, inadequate or no evidence in humans.
 C - Possible Human Carcinogen, limited animal evidence.

c The IRIS inhalation slope factor for arsenic is based on an administered dose from occupational exposure, see text.

d IRIS lists a unit risk factor is µg/m³ equivalent to 0.84 (mg/kg/day)⁻¹ for nickel refinery dust.

e The 7 carcinogenic PAHs are: benzo(a)anthracene, benzo(b)pyrene, benzo(k)fluoranthene, benzo(a)fluoranthene, chrysene, dibenz(a,h)anthracene, and ideno(1,2,3-cd)pyrene.

f The exposure route for aniline is through ingestion of seafood exposed to aniline in Commencement Bay.

TABLE B-7. REFERENCE DOSES FOR NON-CANCER CAUSING CHEMICALS

CHEMICAL	EXPOSURE ROUTE	RFD/RFCa	UNCERTAINTY FACTOR	RFD/RFC CONFIDENCE	TOXIC ENDPOINT	SOURCE
Antimony	Oral	0.0004	1000	Low	reduced lifespan, altered cholesterol levels	IRIS
Arsenic	Oral	0.0003-0.0008	3	Medium	hyperpigmentation, hyperkeratosis of skin	Glass & SAIC (1992) IRIS
Beryllium	Oral	0.005	100	Low	no adverse effects at this dose	IRIS
Cadmium	Oral	0.0005 (water)	10	High	proteins present in urine	IRIS
		0.001 (food)	10	High		
	Dermal	0.000025		Low	proteins present in urine	see text
Chromium Vi	Oral	0.005	500	Low	no adverse effects at this dose	IRIS
Copper	Oral	0.04			gastrointestinal irritation, flu-like disease	HEAST
Lead	Oral	500 mg/day			neurological and behavioral effect	U.S. EPA (1990e)
Manganese	Oral	0.005 (water)	1	Medium/low	central nervous system effects	IRIS
		0.14 (food)	1	Medium	central nervous system effects	IRIS
Mercury	Oral	0.0003	1000		kidney effects	HEAST
	Inhalation	0.0003	30		neurological	HEAST
Nickel	Oral	0.02	300	Medium	neonatal mortality, dermatological effects	IRIS
Selenium	Oral	0.005	3	High	selenium poisoning, biochemical alterations	IRIS
Silver	Oral	0.005	3	Low	skin discoloration	IRIS
Thallium	Oral	0.00007	3000		hair loss, possible liver effects	HEAST
Zinc	Oral	0.2	10		ANEMIA	HEAST

IRIS Integrated Risk Information System, U.S. EPA (1993b).

HEAST Health Effects Assessment Summary Tables, U.S. EPA (1992d).

RfC Reference Concentration.

RfD Reference Dose.

a Units of Oral RfD are mg/kg/day; Units of Inhalation are mg/m³, unless noted.

b Results of the uptake/biokinetic model (Glass and SAIC, 1992) is used to assess lead in soil for the residential scenario.

TABLE B-8. ARARs ANALYSIS

The following requirements are applicable or relevant and appropriate requirements (ARARs) for the cleanup of the Asarco Smelter.

ARARs	Summary	Comment
FEDERAL ARARs		
RCRA		
40 U.S.C. § 6901 et seq.		RCRA § 3001(b) (a) (A) (11) and 56 FR 27300 exempt primary copper smelter slag from RCRA. Therefore, RCRA is not an ARAR for slag. Other wastes on-site may be characteristic hazardous waste in which case RCRA regulations are potential ARARs. There are no known listed wastes on-site.
40 CFR Part 261		
Identification and Listing of Hazardous Waste	Standards applicable in identifying solid wastes involved in site remediations that are subject to regulation as hazardous wastes.	
40 CFR Part 262		
Standards applicable to Generator of Hazardous Waste	These packaging and administrative requirements apply if hazardous waste is shipped off-site.	Pursuant to EPA's AOC policy, these requirements do not apply to on-site movement of hazardous waste. (55 Federal Register 8756, March 8, 1990).
40 CFR Part 264		
Standards for Owners and Operator of Hazardous Waste Treatment, Storage, and Disposal Facilities		The substantive standards detailed below are ARARs for the smelter site remediation if on-site treatment, disposal, or storage of hazardous remediation waste takes place.
40 CFR § 264.18(b)		
Location standard for floodplain	Standards require that washouts from a 100-year flood be prevented.	These requirements apply only to areas on-site deemed within a 100-year floodplain.
Subpart F: Release From Solid Waste Management Units		The requirements of Subpart F are applicable to construction and operation of an OCF.

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
40 CFR § 264.91	Required programs	Substantive monitoring and response requirements may be applicable if hazardous constituents are detected at points of compliance.
40 CFR § 264.92	Groundwater protection standard	Standard requires that the hazardous constituent limits are not exceeded beyond the point of compliance in the uppermost aquifer underlying the waste management area.
40 CFR § 284.93	Hazardous constituents	Standards by which EPA identifies the hazardous constituents to which the above groundwater protection standard applies.
40 CFR § 264.94	Concentration limits	Concentration limits are set forth for the hazardous constituents identified under 40 CFR § 264.93.
40 CFR § 264.95 - § 284.99	Monitoring requirements	Monitoring requirements are set forth to ensure compliance and detect contamination.
Subpart G: Closure and Post-closure		Subpart G ARARs are applicable to an OCF.
49 CFR § 264.111	Closure performance standard	A TSD facility must be closed in a manner which minimizes the need for further maintenance and protects human health and the environment.
4.0 CFR § 264.114	Disposal or decontamination of equipment, structures and soils	All contaminated soils, equipment and structures must be properly disposed of or decontaminated.

TABLE B-8. ARAR8 ANALYSIS (Continued)

ARARs	Summary	Comment
40 CFR § 264.117	Monitoring is required alter closure is completed.	
Post-closure care and use of property		
Subpart L: Waste Piles		
40 CFR § 264.251	Requirements include protection from precipitation and surface water run on, control of dispersal of waste by wind, and no generation of leachate.	
Design and operating requirements		
Subpart N: Landfills		The requirements of Subpad N are applicable to construction of an OCF.
40 CFR § 264.301	Landfill standards require liners and leachate collection systems constructed of materials which provide sufficient protectiveness of human health and the environment.	
Design and operating requirements		
40 CFR § 264.303	Monitoring of liner integrity required.	
Monitoring and inspection		
40 CFR § 264.310	Closure of a landfill requires a cover which minimizes migration of liquids, functions with minimum maintenance, and provides long-term Integrity.	Monitoring and maintenance is required during the post-closure period identified by EPA.
Closure and post-closure care		
40 CFR § 268		
Land Disposal Restrictions		
40 CFR § 268.35	Contaminated soil and debris that are hazardous wastes under RCRA are prohibited from off-site land disposal unless treated pursuant to treatment standards.	Under the EPA AOC policy, Land Disposal Restrictions (LDRA) are not applicable to disposal of remediation waste within an area of contamination. If contaminated soil and debris are disposed of off-site, LDRs are applicable requirements.
Waste specific prohibitions third-third wastes		

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
40 CFR Part 268, Subpart D		
Treatment Standards	Contaminated soil and debris shipped off-site for disposal at a RCRA landfill must be treated before disposal.	If soil and debris are shipped off-site to a RCRA TSD facility and LDR treatment standards apply, a treatability variance may be necessary.
40 CFR § 257.3		
Criteria for classification of solid waste disposal facilities and practices.	A solid waste facility which disposes of non-hazardous waste must meet the following criteria or it will be considered an open dump and be prohibited under RCRA § 4004. A facility located in a floodplain must not wash out in the event of a flood. A facility must not jeopardize endangered species, violate ground water or surface water quality standards or violate air quality standards.	These requirements apply if non-hazardous wastes are disposed of on-site.
40.CFR Part 257, Appendix I		
CLEAN WATER ACT		
33 U.S.C. §§ 1251 et seq.		
CWA §§ 303 and 304 (Federal Water Quality Criteria)	Pursuant to CERCLA § 121(d)(2)(B)(i), otherwise non-enforceable water quality criteria, developed by EPA for surface water, are ARARs. Two kinds of water quality criteria have been developed: one for protection of human health, and another for protection of aquatic life.	
33 U.S.C. § 404 and 40 CFR Part 230		
Discharge of Dredged or fill material	Mitigation measures required for potential adverse impacts to intertidal habitat or wetlands.	
40 CFR § 122.26		
Storm water discharges	NPDES permit standards may apply if it is determined that stormwater discharge contributes to a violation of a water quality standard or is a significant contributor of pollutants to waters of the U.S.	

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
40 CFR Part 125 - Subpart A	Standards of control for direct dischargers must meet technology-based requirements. Best conventional pollution control technology (BCT) is applicable to conventional pollutants. Best available technology economically achievable (BAT) applies to toxic and non-conventional pollutants.	For CERCLA alots, BCT/BAT requirements are determined on a case-by-case basis using best professional Judgment (BPJ).
40 CFR Part 126 - Subpart K	Best management practices (BMPs) must be observed when undertaking Industrial activities which may result in significant amounts of pollutants reaching surface waters.	BMPs are applicable to control the release of hazardous pollutants into surface waters during the smelter cleanup.
40 CFR Part 126 - Subpart M	Discharges to marine waters are permitted as long as the discharge will not cause unreasonable degradation of the marine environment.	NPDES permit is not required if the discharge is within the site boundaries, however, substantive requirements that would otherwise be required under a permit are ARARs. A monitoring program may be required to assess impact of a discharge. Such a requirement is "relevant and appropriate".
40 CFR Part 6, App. A	Requires federal agencies to conduct its activities to avoid, if possible, adverse impacts associated with the destruction or modification of wetlands and occupation or modification of floodplains.	
Statement of Procedures on Floodplain Management and Wetlands Protection		
WASHINGTON INDIAN (PUYALLUP) LAND CLAIMS SETTLEMENT		
25 U.S.C. § 1773	Requires protection of fisheries through control of discharges to Commencement Bay. Compliance with the Settlement Act generally is attained through compliance with ARARs under federal or state law on discharges to surface water.	

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
RIVERS AND HARBORS ACT OF 1899		
33 U.S.C. § 401 et seq.		
33 U.S.C. § 403		
Obstruction of navigable waters generally; wharves; piers, etc.; excavation and filling in.	Controls the alteration of the navigable waters (i.e., waters subject to ebb and flow of the tide shoreward to the mean high water mark). Activities controlled include construction of structures such as piers, berms, and installation of pilings.	Some minor activities may occur on-site along the shoreline during remediation. No permit is required for on-site activities.
SAFE DRINKING WATER ACT		
42 U.S.C. § 300(f) et seq.		
40 CFR Part § 41 - Subpart B		
Maximum Contaminant Levels	Maximum contaminant levels (MCLs) are enforceable drinking water standards which are protective of human health. The standards take into account available treatment technology and cost.	
40 CFR Part 141 - Subpart F		
Maximum Contaminant Level Goals	Maximum contaminant level goals (MCLGs) are enforceable health-based goals for drinking water quality and are non-enforceable. CERCLA § 121 (d) (2) outlines use of MCLGs in remedial actions (see also 55 FR 8750.53).	
CLEAN AIR ACT		
42 U.S.C. § 7401 et seq.		
40 CFR Part 50		
National Primary and Secondary Ambient Air Quality Standards	These regulations set forth the National Primary and Secondary Ambient Air Quality Standards (NAAQS) which were developed to protect the public health (allowing an adequate margin of safety).	Some on-site remedial activities, such as handling contaminated soil and using an air stripper may be minor sources of air emissions.

TABLE B-8. ARARS ANALYSIS (Continued)

ARARS	Summary	Comment
ENDANGERED SPECIES ACT		
16 U.S.C. §§ 1531 et seq.	Federal agencies must ensure that actions they authorize, fund, or carry out are not likely to adversely modify or destroy critical habitat of endangered or threatened species.	
MARINE MAMMAL PROTECTION ACT		
16 U.S.C. §§ 1361 et seq.	EPA must ensure that its actions do not involve the unauthorized taking of marine mammals.	
HAZARDOUS MATERIALS TRANSPORTATION ACT		
49 U.S.C. Ap. §§ 1801 et seq.		
49 CFR Parts 171-177		
U.S. Dept. of Transportation-Subchapter C. Hazardous Materials Regulations	Regulations provide for packaging, documentation, and transport of hazardous waste.	These regulations are requirements for any hazardous waste shipped off-site for disposal during remediation.
NATIONAL HISTORIC PRESERVATION ACT		
16 U.S.C. §§ 470 et seq,	This statute requires EPA to consider effects of remedial actions on historic properties. (This evaluation was conducted in connection with demolition activities.)	The administrative procedural requirements, such as the Cultural Resources Plan, are not ARARS.
ARCHAEOLOGICAL AND HISTORICAL PRESERVATION ACT.		
16 U.S.C. §§ 4699-1	In the event that significant scientific, prehistorical, or archaeological data is present on a site, EPA must approve the remedial activities so that such data is preserved.	
STATE ARARS		The following state statutes and regulations are ARARS only if they result in more stringent standards than those required under federal statutes and regulations. (Requirements under federal programs that

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
<p>MODEL TOXICS CONTROL ACT Chapter 70.105D RCW WAC 173-340-360</p>	<p>Requires that cleanup actions, to the extent practicable, comply with cleanup standards, use permanent solutions, provide for reasonable time frames, minimize amount of untreated hazardous substances, restore ground water, and utilize long-term monitoring and institutional controls if on-site disposal occurs.</p>	<p>Administrative requirements in this section regarding a cleanup action plan and public participation are not ARARs.</p>
<p>WAC 173-340-440</p>	<p>These measures are undertaken to limit or prohibit activities that may interfere with the integrity of a containment area or some other cleanup action.</p>	
<p>WAC 173-340-705</p>	<p>Method B cleanup levels are potentially applicable to all sites. Standards must be at least as stringent as applicable state and federal law and they must not result in adverse impact of aquatic and terrestrial life. For hazardous substances for which sufficiently protective standards have not been established, standards can be established by estimations which result in no acute or chronic toxic effects using a hazard quotient of (1); or for carcinogens, concentrations with upper bound excess cancer risk of 1 X 10⁻⁶.</p>	<p>At this Site, Method B is applicable in setting cleanup levels.</p>
<p>WAC 173-340.706</p>	<p>Method C cleanup levels may be established at concentrations equal to background or at concentrations which minimize overall threats if attainment of A or B levels will increase the threat to human health and the environment. These levels must be estimated by using a hazard quotient of (1) and a 1 X 10⁻⁵ cancer risk for carcinogens.</p>	

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173.340.707	Analytical considerations	When the cleanup level is below the practical quantitation limit (PQL), the PQL will become the standard as long as it is not greater than 10X the method detection limit.
WAC 173.340.708	Human health risk assessment procedures	This section sets forth the risk assessment framework utilized to establish cleanup standards.
WAC 173.340-720	Ground water cleanup standards.	Methodologies for determining background concentrations are potential ARARs.
Ground water cleanup standards.	This section sets forth guidelines for ground water cleanup levels, points of compliance, and the ground water classification system. Ground water cleanup levels are based upon the highest beneficial use (i.e. drinking water) unless the ground water is not a potential source due to high concentrations of dissolved solids or insufficient yield. Further, if there is an extremely low probability that the ground water will be a future source of drinking water, the cleanup levels may be based on protection of nearby surface water.	
WAC 173-340-730	Surface water cleanup standards	Method A cleanup levels are based on the state and federal water quality criteria. Method B cleanup levels require compliance with these criteria unless it can be shown that they are not relevant to the specific water body. Also cleanup levels that are estimated must result in no acute or chronic effects on fish or shellfish and a cancer risk less than or equal to 1×10^{-6} . Less stringent Method C levels may be used if consistent with applicable laws, all practicable methods of treatment are utilized, and institutional controls are implemented. This section also sets forth points of compliance and requires compliance monitoring.
		At this Site, Method B is applicable to discharges to surface water.

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173-340-740		
Soil cleanup standards	This section sets forth residential cleanup levels. For sites undergoing routine cleanup, Table 2, in this section, sets forth applicable standards. Method B allows cleanup standards not already established, to be calculated using concentrations that will not result in toxic effects, contamination of ground water, or a cancer risk that is no greater than 1×10^{-8} .	
WAC 173-340-745		
Soil cleanup standards for Industrial sites	Industrial cleanup levels are less stringent than those set for residential areas. To be classified as an industrial site, the following criteria must be satisfied: the site is zoned Industrial use; site was historically used for industrial purposes; adjacent property is currently used or designated Industrial; the site will be zoned industrial for the foreseeable future; and the cleanup action provides for institutional controls. An amendment to state law provides that industrial properties include properties that are or have been characterized by or committed to traditional industrial uses.	
WAC 173-340-750		
Cleanup standards to protect air quality	Removal and containment measures which release hazardous substances to the air must be conducted in accordance with air standards. Residential standards are most stringent. Industrial standards may be established on a case-by-case basis as long as concentrations result in no toxic effects and cancer risk is no greater than 1×10^{-5} .	
WATER POLLUTION CONTROL		
WAC 173-201-035		
General considerations	Guidelines are set forth which apply to water quality criteria and classifications such as the antidegradation policy and criteria for short-term modification of water quality standards.	

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173-201-045	General water use and criteria classes This section sets forth water quality criteria for each type of water classification. Criteria considered includes fecal coliform, dissolved oxygen, dissolved gas, temperature, pH, turbidity, toxics, and aesthetics.	
WAC 173-201-047	Toxic substances Water quality standards (fresh and marine water) are set forth for several substances deemed toxic. Such substances may not be introduced above natural background if they adversely affect characteristic water uses, public health, or cause acute or chronic conditions.	
WAC 173-216-060	Prohibited Discharges Discharges to a municipal sewage system must not interfere with the system's operation.	
WAC 173-220-120	Prohibited discharges Prohibits specific discharges into waters of the state such as pollutants that impair anchorage and navigation, and toxic pollutants prohibited under CWA § 307.	
WAC 173-220.130	Effluent limitations, water quality standards, and other requirements and/or permits This section sets forth substantive requirements for NPDES permits such as effluent limitations based on known, available, and reasonable methods of treatment. Effluent limitations may be more stringent than those standards developed under the CWA when necessary to meet water quality standards.	
WAC 173-220-210	Monitoring, recording and reporting Monitoring is required to ensure that discharges comply with effluent limitations.	Recording and reporting requirements in this section are administrative and, therefore, are not ARARs.
Chapter 173-240 WAC	Submission of Plans and Reports for Construction of Wastewater Facilities Construction requirements are set forth for wastewater facilities.	The engineering report and plan requirements in this section are administrative and, therefore, are not ARARs.

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
POLLUTION DISCLOSURE ACT OF 1971		
Chapter 90.52 RCW		
RCW 90.52.040		
Wastes to be provided with available methods of treatment prior to discharge into waters of the State.	Regardless of water quality and minimum water quality standards, all wastes must undergo all known, available, and reasonable methods of treatment prior to discharge, except as provided below.	
RCW 90.54.020		
General dedaration of fundamentals for utilization and management of waters of the state.	Regardless of water quality, all discharges to the waters of the state must be provided with all known, available, and reasonable methods of treatment, except where overriding considerations of the public interest will be served.	
CONSTRUCTION PROJECTS IN STATE WATERS		
Chapter 220.110 WAC		
Hydraulic Code Rules	Requirements are set forth for construction projects along waterways, such as bulkhead construction and piling installation, that are designed to protect marine life.	A hydraulic project approval is not required since it is a type of administrative permit.
WELLWATER CONSTRUCTION		
Chapter 18.104 RCW		
WAC 173-160, Part 1		
General requirements	Requirements are set forth which pertain to design and construction of wells generally; such as preservation of natural barriers to prevent water flow between aquifers and permanent sealing.	Permit requirements and other administrative provisions in this section are not ARARs.

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173-160, Part 3		
Resource protection wells	Specific design and construction requirements are set forth for the drilling and use of monitoring and observation wells.	
UNDERGROUND INJECTION CONTROL PROGRAMS		
Chapter 173-218 WAC	This program requires that injection wells not adversely affect the beneficial use of an underground source of drinking water.	If an injection well is utilized on the smelter site it will be used to inject salt water for treatment purposes and will not adversely affect existing groundwater. These wells would be considered Class V wells that do not inject waste fluids.
HAZARDOUS WASTE MANAGEMENT ACT	This statute provides statutory authority for the Dangerous Waste Regulations (DW) described below.	
Chapter 70.105A RCW		
WAC 173-303-016		
Identifying solid waste.	Guidelines are set forth which identify solid wastes that are also dangerous wastes.	
WAC 173-303.020		
Applicability	Dangerous waste regulations apply to generators, transporters, and owners and operators of TSD facilities.	According to the State's Area of Contamination (AOC) Policy, the movement of DW within an area of contamination is not considered generation. Therefore, the DW regulations are not automatically triggered but may be relevant and appropriate. Similarly, containment, treatment, and disposal of consolidated wastes within an AOC does not automatically trigger the DW regulations. (Interprogram Policy dated September 6, 1991).
WAC 173-303-060		
Notification and Identification numbers	An ID# is required if any dangerous waste is shipped off-site.	Not an ARAR for on-site movement of wastes.
WAC 173-303.070		
Designation of dangerous waste	Procedure for determining whether or not a solid waste is a dangerous waste (DIN) or an extremely hazardous waste (EHW).	

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173-303-071	Excluded categories of waste.	Certain categories of waste may be excluded from the requirements of the dangerous waste regulations. For example, under subsection (3)(i), PCB waste whose disposal is regulated pursuant to 40 CFR § 761.60 is exempt from most DW regulations.
WAC 173-303-081	Discarded chemical products.	A waste is designated a DW if it is a residue from management of chemicals listed on the Discarded Chemical Products List at WAC 173-303-8903.
WAC 173-303-082	Dangerous waste sources.	All wastes or residues from wastes listed on the Dangerous Waste Sources List are to be designated either DW or EHW depending on the circumstances.
WAC 173-303.084	Dangerous waste mixtures.	A waste mixture that has not been designated a DW must be evaluated to determine whether or not toxic constituents, specific hydrocarbons, or carcinogens are present. If present in sufficient quantities, they are to be treated as DW.
WAC 173-303-090	Dangerous waste characteristics	If a waste has characteristics of ignitability, corrosivity, reactivity, or toxicity, it could be designated a DW.
WAC 173-303-100	Dangerous waste criteria.	If a person has established that his waste meets the DW criteria, he is a generator and must comply with appropriate DW regulations for generators. This requirement applies only to those DW which are transported off-site.

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173-303-101	Toxic dangerous wastes. Methods are set forth for determining the toxicity of waste and whether it is a DW or EHW.	
WAC 173-303-102	Persistent dangerous wastes. Procedure is set forth to designate wastes that contain halogenated hydrocarbons and/or polycyclic aromatic hydrocarbons with more than three rings and less than seven rings (PAHs) as either DW or EHW.	
WAC 173-303-103	Carcinogenic dangerous waste. Method for designating a waste as carcinogenic.	
WAC 173-303-104	Generic dangerous wastes. Sets forth the DW number for each of the DW criteria designations.	This requirement is only relevant for wastes shipped off-site for disposal.
WAC 173-303-120	Recycled, reclaimed, and recovered wastes. Exempts some recycled DW from the DW regulations if it does not pose a threat to public health and the environment. For example, scrap metal is exempt from DW regulations.	
WAC 173-303-140	Land disposal restrictions. May require some type of treatment of DW prior to off-site disposal. Treatment of EHW may be required prior to on-site disposal if practicable.	Pursuant to the State's Area of Contamination Policy, the State LDRs are not applicable unless DW is shipped off-site for disposal. Ecology and EPA have agreed to jointly decide the extent of treatment necessary prior to on-site or off-site disposal of EHW.
WAC 173-303-141	Treatment, storage, or disposal of dangerous waste. DW shipped off-site for disposal must be shipped to a properly permitted TSD facility.	On-site disposal of DW 18 subject to the state's AOC policy.
WAC 173-303-150	Division, dilution, and accumulation. The intent of the DW regulations may not be evaded by dividing or diluting wastes.	

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173-303-160		Applicable procedure for measuring waste quantity when containers are utilized for shipment of DW off-site.
WAC 173-303-161		Requirements for overpacked drums such as use of non-leaking inside containers and use of non-reactive material for shipping of DW off-site.
WAC 173-303-180	Manifest.	Manifesting is required when DW is generated.
WAC 173.303-270		Notification requirements apply if a transporter spills DW during transport.
WAC 173-303-283		A DW facility must be designed and constructed, to the maximum extent practical, to prevent: degradation of ground water quality and air quality, destruction of flora and fauna, excessive noise, negative aesthetic impact, unstable hillsides, and endangerment of employees. Processes used must treat, detoxify, recycle, reclaim, and recover waste material to the extent economically feasible.
WAC 173-303-550	Special requirements for facilities managing special waste.	Guidelines by which Ecology will approve less stringent standards for facilities which handle "special wastes".
WAC 173-303-560	Minimum standards for facilities managing special waste.	Minimum standards are set forth which Ecology may approve for "special waste" facilities.
		Special wastes are those that are not considered hazardous waste, under RCRA but are designated a DW under the more stringent state standards.
		These requirements apply only in the event of a spill during transportation of DW off-site.
		Manifesting required only if DW is transported off-site.

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173-303-600	Final facility standards.	This section specifies which TSD facilities are subject to closure requirements.
WAC 173-303-610	Closure and postclosure.	Closure and performance standards require that a facility be closed to minimize need for further maintenance and control, minimize, or eliminate the escape of DW to the environment. The land must also be returned to the appearance and use of surrounding land to the degree possible. All contaminated soils, equipment, and structure must be disposed of properly. Notice of disposal of waste must be recorded on the deed.
WAC 173-303-645	Releases from solid waste management units.	This section sets forth ground-water monitoring requirements for postclosure periods for facilities that are closed without all DW removed. Criteria is listed by which dangerous constituents are identified and concentration limits are determined. Such requirements are "relevant and appropriate."
WAC 173-303-660	Waste Piles	Requirements for temporary storage of dangerous waste, e.g., protection from precipitation.
WAC 173.303-665	Landfills.	Landfills must be constructed with a liner and leachate collection system. There must be system to control run-on and run-off. Upon closure, the landfill must be covered with final cover that provides long-term integrity.
WAC 173-303-9903	Discarded chemical products list.	Lists of chemicals which are designated as either EHW Or DW.

TABLE B-8. ARARS ANALYSIS (Continued)

ARARS	Summary	Comment	
WAC 173-303-9904	Dangerous waste sources list.	All wastes listed are designated as DW.	
WAC 173-303.9905	Dangerous waste constituents list.	List of chemically distinct components of a dangerous waste stream or mixture.	
WAC 173-303-9906	Toxic dangerous waste mixtures graph.	Graph is utilized to determine whether a mixture containing toxics is either a DW or EHW.	
WAC 173-303-9907	Persistent dangerous waste mixtures graph.	Graph is utilized to determine whether wastes containing certain percentages of persistent DW constituents are DW or EHW.	
Solid Waste Management Reduction and Recycling	Chapter 70.95 RWC		
WAC 173-304-130	Location Standards for Disposal Sites.	This section sets forth locational standards regulating proximity of facilities to faults, groundwater, surface water and floodplains.	
WAC 173-304-407	General closure and post-closure requirements.	Closure performance standards are set forth which require that the need for further maintenance be minimized and threats to human health and the environment be controlled or eliminated.	The closure and post-closure plan requirements and other administrative procedures in this section are not ARARS.

TABLE B-8. ARARs ANALYSIS (Continued)

ARARs	Summary	Comment
WAC 173-304-480	Landfilling standards,	These standard, do not apply to inert wastes and demolition wastes but they do apply to problem wastes. Minimum functional standards require that landfill, not contaminate ground water or surface water. A leachate collection system and liner is required. Also facilities located in floodplains must not restrict the flow of the base flood. Water run-on and run-off must be controlled. Also, dangerous waste disposal is prohibited in a solid waste landfill.
WAC 173-304-461	Inert waste and demolition waste landfilling facility requirements.	This section requires that fugitive dust be controlled, that combustible waste be covered to avoid a fire hazard, and that the site be leveled to the extent practicable at closure.
WAC 173-304-490	Groundwater Monitoring Requirements.	Monitoring is required to ensure that groundwater quality is not affected by disposal site.
SHORELINE MANAGEMENT ACT OF 1971	Chapter 90.58 RCW	Local shoreline master programs are set out substantive requirements that apply to construction activities within 200 feet of the shoreline.
		The documentation requirements such as operating plans are administrative and, therefore, are not ARARs.
		The permitting requirement and other documentation requirements in this section are administrative and, therefore, are not ARARs.
		This requirement is "relevant and appropriate."
		Permitting requirements are not ARARs for on-site construction activities.

SUMMARY OF ADDITIONAL SOIL TREATABILITY PILOT-PROJECT FINDINGS

PILOT SCALE TREATABILITY TESTING

OF PLANT SITE SOILS AT THE ASARCO TACOMA SMELTER

ANALYTICAL SUMMARY SUPPLEMENT

Prepared for:

Mr. Thomas L. Aldrich
Plant Site Manager
ASARCO Incorporated
P.O. Box 1677
Tacoma, WA 98401

Prepared by:

Hydrometrics, Inc.
2727 Airport Rd.
Helena, MT 59601

December 1994

As outlined in the Pilot Scale Treatability Sampling and Analysis Plan, specific objectives of the pilot scale testing project included:

1. establish an analytical testing program to assess the effectiveness of the treatment in reducing contaminant leachability;
2. optimize additive mix proportions so as to provide lowest cost treatment which meets or exceeds preliminary remediation goals;
3. evaluate sensitivity of treatment effectiveness to variations in feed material quality;
4. refine process operating ranges and monitoring procedures to assure consistent performance during full scale operation.

Extensive chemical and physical tests have been performed to characterize the effectiveness of the treatment method in reducing contaminant leachability. Leach test results on field control lot samples and laboratory compaction samples suggest that the ARCHON solidification/stabilization process successfully immobilized contaminants, resulting in undetectable or low leachable concentrations of Ag, As, Cd, Cu, Ni, Pb, Sb, Se, TI and Zn. This reduction in leachability was maintained for all treatment mixes, independently of any variations in pre-treatment soil feed or treatment mix percentages.

Physical parameter test results were less conclusive, as physical tests performed on sample molds are apparently not completely representative of actual large scale post-treatment physical properties. Differences in heat generation/retention and associated curing processes are believed to cause observed differences in percent volume change calculations, and may also result in differences between laboratory and field values of permeability and/or compressive strength. Although tests conducted may provide some insight on the physical characteristics of poster soil samples, it should be noted that conditions in the field are likely to be different than those implied by mold test results.

ASARCO SMELTER SITE ON-SITE CONTAINMENT FACILITY EVALUATION

MEMORANDUM

SUBJECT: Asarco Smelter Site
On-site Containment
Facility (OCF)

FROM: Catherine Massimino
Senior RCRA/Superfund
Technical Specialist

TO: Piper Peterson
Regional Project Manager
SF Management - II

This is in response to your request for assistance in reviewing the impact of treatment of 15% of the contaminated soils prior to placement in a landfill at the Asarco Smelter Site in Tacoma, Washington.

An evaluation of potential percolation from an on-site containment facility (OCF) located in the central area of the Asarco site as shown on Figure 6-3-6, of Asarco's Smelter Site January 1993, Remedial Investigation Report (RI), was performed. This evaluation bracketed an expected design scenario meeting RCRA landfill standards (hereafter referred to as Scenario A-OCF Good Cap and Liner), and a scenario reflective of long-term deterioration Scenario A of the OCF (hereafter referred to as Scenario B-OCF Poor Cap and No Liner). Both scenarios reflected 25 feet of waste and a landfill surface area of 18 acres. This will accommodate two (2) feet of contaminated soil in addition to the amount that Asarco had approximated on Exhibit A5-3-2 Volume 4-Appendices Asarco Tacoma Plant Feasibility Study (FS) of its conceptual OCF design as necessary to accommodate 240,000 cubic yards of wastes. This additional two (2) feet of waste should allow about a 10% safety factor for waste volume.

This review was performed utilizing the Hydrologic Evaluation of Landfill Performance (HELP) model Version 3.01 The OCF Good Cap and Liner configuration and layers modeled in this review are very similar to the scenario evaluated by Asarco under Appendix 5-2b of Volume 4 of the FS with the following major exceptions: a) used model synthetically generated precipitation data from Olympia, refined to include monthly precipitation data from Seattle-Tacoma International Airport instead of 20 years of historic daily precipitation data from Seattle-Tacoma International Airport, a waste layer depth of 25 feet versus 30 feet, a surface area of 18 acres, including OCF liner and cap components versus 10.5 acres, which including only the contaminated soil, SCS runoff curve number was computed by the model, input of leakage fraction for the flexible membrane liner (FML) was replaced by factoring into the model values reflective of good quality for pinhole density, installation defects and overall placement quality, and the model was run for 100 years versus 20. The detailed model inputs and outputs can be found in Attachment 1 to this memorandum.

The major differences in input values for the two scenarios can be found on Table 1. The largest difference being the assumption for the Poor Cap and No Liner Scenario B that the bottom liner has so deteriorated that it is no longer functioning as a liner and the percolation being evaluated is from the bottom of the waste. The results of this modeling are summarized in Table 2.

The above HELP modeling results were utilized to estimate contaminate loading from the OCF into Commencement Bay without any pretreatment of the contaminated soils and with 15% of the contaminated soils pretreated. Based on this comparison, which is presented in Table 3, the difference between the arsenic loading from the OCF Scenario B (worst case percolation) of 106 grams per day, when none of the waste is treated versus 15% treated of 90 grams per day, is very minimal. Based on this evaluation, treatment of 15% of the waste can not be justified. As the HELP model is designed to be a comparative evaluation tool this data is not appropriate for use in performing an evaluation of the impact of this loading to Commencement Bay. In addition, it should be noted that this loading comparative determination did not account for dilution or absorption in the soil column of the contaminant during the travel of the percolation out of the OCF to Commencement Bay.

TABLE 1

HELP MODEL MAJOR INPUT VALUE DIFFERENCES BETWEEN SCENARIOS A & B

INPUT VALUES	A. OCF GOOD CAP AND LINER	B. OCF POOR CAP AND NO LINER
Hydraulic conductivity of low permeability soil layer in cap	1 X 10 ⁻⁷ cm/sec	1.2 X 10 ⁻⁶ cm/sec
FML		
Pinhole density	.75 holes/acre	1 hole/acre
Installation defects	2.0 holes/acre	15 holes/acre
Placement Quality	Good	Poor
SCS Runoff Curve #	50.40 based on a good stand of grass	74.40 based on a poor stand of grass
Maximum Leaf Area Index	3.5 based on a good stand of grass	1.0 based on a poor stand of grass
Bottom Liner System	Leachate Collection and Removal System FML Low permeability soil layer Leak Detection Collection and Removal System FML Low permeability soil layer	No functional bottom liner system

STATE DEPARTMENT OF ECOLOGY'S CONCURRENCE LETTER

STATE OF WASHINGTON

DEPARTMENT OF ECOLOGY

P.O. Box 47600 ! Olympia, Washington 95504-7600 ! (206) 407-6000 ! TDD Only (Hearing Impaired)
(206) 407-6006

March 22, 1995

Mr. Randy Smith
US EPA Region X
1200 Sixth Avenue
Seattle, WA 98101

Dear Mr. Smith:

Re: Record of Decision for the Asarco Tacoma Smelter Facility

The State of Washington concurs with the selected remedy and phased approach described in this Record of Decision for the Asarco Tacoma Smelter facility. The combination of measures to excavate and consolidate the more highly contaminated soils and debris in a containment facility with design equivalent to federal hazardous waste disposal standards, to cap the entire site, and to provide certain site restrictions is appropriate and protective against exposure to such soils.

The current ROD provides for measures to divert surface waters from contact with contaminants, however, the ROD provides for additional remedial measures to be taken on surface water, should such further measure be necessary. The current ROD is an interim action for ground water. Final ground water remediation will be addressed in a separate, second-phase ROD that will be prepared after the impacts of the soils actions and water diversion measures have been evaluated. This approach and the selected remedy are deemed to be in compliance with the environmental laws and regulations of the state.

If you have any questions, please contact Bruce Cochran at (360)407-7227.

Sincerely,

Mary E. Burg, Program Manager
Toxics Cleanup Program

1.0 INTRODUCTION

1.1 PURPOSE

This document sets out the Statement of Work (SOW) for Point Ruston, LLC (Point Ruston) to implement the remedial actions selected in the Records of Decision (RODs) for the Commencement Bay Nearshore/Tideflats Superfund Site, Operable Unit 02, Asarco Tacoma Smelter Facility, Tacoma/Ruston, Washington (OU2) and portions of Operable Unit 06, Marine Sediments and Groundwater (OU6). The descriptions of the remedies for these operable units are covered in their respective RODs and Remedial Designs. As the implementation of the remedial actions commence, EPA will review and potentially approve modifications to the remedial actions based on value engineering and other reviews performed by Point Ruston.

It was the responsibility of ASARCO Incorporated (Asarco) to prepare, and submit for approval in accordance with an earlier SOW, work plans and design documents for each remedial action. Point Ruston is assuming the work that Asarco was performing. Point Ruston will complete any plans which have not been finalized by Asarco and approved by EPA, and may prepare and submit for acceptance in accordance with this SOW, additional work plans and design addenda/modifications to complete the remaining remedy as outlined herein or rely on those completed by Asarco. The EPA has reviewed this SOW and has determined that work undertaken in accordance with its terms will be consistent with the National Contingency Plan (NCP).

Asarco is responsible for performing the work to implement the selected remedy. Asarco declared bankruptcy in August 2003, and sold the property to Point Ruston. Point Ruston will perform the remaining remediation tasks. EPA shall review Point Ruston's work products and schedules, and conduct oversight of Point Ruston's activities throughout the performance of the remaining work. Point Ruston shall assist EPA in conducting oversight activities.

1.2 DOCUMENT ORGANIZATION

This document is organized in the following manner. Section 1 summarizes the site history, the purpose of the SOW and document organization. Section 2 details the Remedial Design and Remedial Action activities that must be performed at the Site to satisfy the Performance Standards set forth in the RODs for the Site and the Amended Consent Decree (CD), and describes the progress made by Asarco toward meeting these requirements. Section 3 discusses the remaining remedial actions, and how Point Ruston will either follow the documents prepared by Asarco, or submit documents for EPA review and approval which shall detail how Point Ruston will proceed with the remaining Remedial Action as described in Section 2. Section 4 provides a list of guidance materials that Asarco reviewed as part of Remedial Design pursuant to their CD and SOW. The list also serves as guidance for design changes Point Ruston may make to remaining remediation tasks.

1.3 SITE HISTORY AND DESCRIPTION

The Asarco Tacoma Smelter Superfund site (OU2 site or Smelter Site) and the Marine Sediments and Groundwater site (OU6 site or Groundwater Site) are operable units (OUs) of the larger Commencement Bay Nearshore/Tideflats (CB/NT) Superfund site. The CB N/T site was listed on the interim priority list by the U.S. Environmental Protection Agency (EPA) in 1981, and included in the first published National Priorities List in September 1983. The Smelter Site is located on the western shore of Commencement Bay and consists of 80 acres of property owned by Asarco until completion of the sale to Point Ruston (the smelter property or Smelter), and a 23 acre slag peninsula owned by the Metropolitan Park District of Tacoma. The Marine

Sediments and Groundwater site encompasses the sediments offshore of the smelter property and slag peninsula, the Yacht Basin sediments located in the marina formed by the slag peninsula, and the groundwater beneath the Smelter Site. The Town of Ruston, the City of Tacoma and the Metropolitan Park District are the three municipalities who have zoning and permitting jurisdiction at the Smelter Site. Two Records of Decision (RODs) have been issued by EPA. The OU 2 ROD for the Smelter Site addresses contaminated soils, slag, demolition debris, surface water and groundwater. The

OU 6 ROD for Marine Sediments and Groundwater site addresses contaminated sediments offshore of the smelter property and slag peninsula and in the Yacht Basin, and also the groundwater beneath the Smelter Site (note that both RODs address groundwater). OU 06 includes marine sediments that extend approximately 1,000 feet offshore into Commencement Bay. The marine sediments of interest occur in an area directly offshore of the Smelter Site. Intertidal and subtidal slopes range from relatively flat to steep inclines (slopes to approximately 50 percent). The steepest submarine slopes were generally formed by placing molten slag directly into the water where it hardened in massive forms. Water depths in the steepest gradient area within OU 06 are up to approximately 300 feet.

The general area of the former Asarco Smelter consists of steep slopes extending down to Commencement Bay producing bluffs along portions of the shoreline. The Smelter Site has been divided into six “source areas” where the highest measured concentrations of contaminants in the soils appear: the Stack Hill area, Cooling Pond area, Arsenic Kitchen area, Copper Refinery area, the Fine Ore Bins building and the southeast area of the Smelter Site. Many of the original smelter buildings and structures were constructed on slag fill, which extended the existing shoreline when molten slag from smelting operations was poured into Commencement Bay. A car tunnel and railroad tunnel are located between the Stack Hill and the Arsenic Kitchen area. Some dense vegetation exists on steep slopes (for example, the stack hill) and along the bluffs above Commencement Bay.

The adjacent slag peninsula is composed of different forms of slag (molten or granulated) that were poured or placed on many occasions between 1917 and 1970. Its primary surface features are the Tacoma Yacht Club building, a paved access road, and paved parking areas. An estimated 15 million tons of slag exist at the smelter property and slag peninsula.

Surface water features on the smelter property include surface water in the Cooling Pond and south and east Stack Hill areas and a number of springs and seeps around the Stack Hill and Arsenic Kitchen areas. Surface water drains into one of four drain systems and then into outfalls at the Smelter Site, which are called: the city (owned by the City of Tacoma), north, middle, and south outfalls. The latter three were owned by Asarco, and are addressed as part of the remedial action.

A complex pattern of groundwater flows through or beneath the smelter property, including through the slag, into Commencement Bay. Three primary groundwater aquifers (water bearing zones) have been identified; two relatively shallow aquifers and one deep aquifer. A thick silt barrier exists between the shallow and deep aquifers throughout much of the Smelter Site. Because of the high degree of fractures in and porous nature of the slag, the tides bring seawater inland several hundred feet where it mixes with groundwater. The groundwater within each of the three aquifers is designated as either potential drinking water (Class IIB) or as non-potable water (Class III). No one is currently drinking the groundwater at or near the Smelter Site.

Prior to 1890, a number of sawmills were active in the area and deposited wood waste along the shoreline. From 1890 through 1912, the property was used as a lead smelter and refinery. Asarco purchased the property in 1905 and converted it in 1912 into a facility to smelt and refine copper from copper-bearing ores and

concentrates shipped in from other locations. By-products of the smelting operations were further refined to produce other marketable products, such as arsenic, sulfuric acid, liquid sulfur dioxide and slag. Asarco ended operation of the smelter in 1985.

Metals were released into the soil, air, and Commencement Bay as a result of the smelting and refining operations. Some examples of the metals present at the Smelter Site are arsenic, cadmium, copper, lead, and zinc. Metals in slag or released into soil have migrated to surface and groundwater at the Smelter Site. Ores which were smelted at the Smelter Site have left metals in the building and structures on the Smelter Site.

There are no listed Resource Conservation and Recovery Act (RCRA) wastes at the Smelter Site or disposed in the OCF. In several areas, soils are RCRA characteristic waste because they fail the Toxicity Characteristic Leaching Procedure. Slag is not a RCRA waste under the Bevill exemption (40 C.F.R. § 261.4).

There are no known floodplain zones or endangered species at this Smelter Site. There are several small areas of the Smelter Site, other than the Cooling Pond, which have been identified as potential wetlands. If these areas are confirmed as wetlands and if remediation occurs in these areas, the extent of mitigation necessary, if any, will be determined during Remedial Design. The Cooling Pond and immediately surrounding area are not a wetlands within the definition of “waters of the United States” since it was part of a waste treatment system and qualifies for the specific exemption for treatment ponds in 33 C.F.R. § 328.3 (1)(7).

2.0 DESCRIPTION OF THE REMEDIAL DESIGN AND REMEDIAL ACTION ACTIVITIES

This section describes the remedies outlined in the two RODs, describes progress made in their implementation, and outlines the remaining work to be performed.

Asarco completed the design and implemented much of the Remedial Action for OU2 to meet the Performance Standards set forth in the ROD, the CD, the SOW and the associated Remedial Design Reports (RDRs). The ROD for OU6 supported the remedial alternatives being performed as part of smelter remediation (i.e. capping the Smelter Site, diverting groundwater) as being protective of the groundwater and surface water. With regard to sediment remediation, Asarco completed a design for OU6, but did not implement a remedy.

The activities described below include those portions of Remedial Design and Remedial Action completed by Asarco and remaining activities to be completed by Point Ruston.

To simplify the design and implementation of the Remedial Action for OU2, the work was divided into eight different remediation activities (Primary Activities or PAs). These Primary Activities are shown in Table 2-1 and include: PA 1.0 On- Site Containment Facility; PA 2.0 Soil Removal and Replacement; PA 3.0 & 8.0 Grade, Terrace and Cap Site/Breakwater Peninsula Remediation; PA 4.0 Groundwater Monitoring and Controls; PA 5.0 Shoreline Stabilization and Protection; PA 6.0 Surface Water Drainage and Controls; and PA 7.0 Demolition of Remaining Structures. In addition, Wetlands Identification and Mitigation Activities are described in Section 2.6. The design and implementation of the OU6 Remedial Action was divided into Groundwater Remediation, Nearshore/Offshore Sediment Capping, and Yacht Basin Dredging.

Each remaining or partially remaining remedial activity, with the requirements specific to it, is detailed below. Remaining remediation activities for OU2 include portions of all the Primary Activities except for PA 2.0 Soil Removal and Replacement. Remaining remediation activities for OU6 include capping contaminated sediments,

dredging of the yacht basin and groundwater monitoring. As described below, Point Ruston will only be implementing a specific portion of the remedial action for the yacht basin in the OU6 ROD.

Requirements which apply to all of the remediation activities are not repeatedly listed for each remediation activity but are instead outlined in Section 2.9 Other Actions.

2.1 ON-SITE CONTAINMENT FACILITY (Primary Activity 1.0)

Remedial Action:

Excavate and dispose the source area soils and granular slag into an onsite containment facility (OCF) which will be constructed with surface and groundwater diversion controls. Construct the OCF to withstand earthquakes and landslides to the extent practicable.

2.1.1 Design and Construction

Asarco constructed an on-site containment facility (OCF) at a location supported by the findings of the geotechnical investigation at the Smelter Site and approved by EPA. The liner; cap; leak detection, collection and removal system; leachate collection and removal system; and surface run-on and run-off control systems were designed and constructed to meet federal and state standards for a hazardous waste landfill. An OCF As-Built Report was completed in December 2005. It will be submitted for EPA review and approval in 2006 by Asarco. An Operation, Maintenance, and Monitoring Plan was also written by Asarco to address operation and maintenance for the OCF to satisfy the requirements of 40 CFR Sections 264.115-120 and 264.310. The Operation, Maintenance and Monitoring Plan contains a response action plan which describes monitoring frequency, reporting and maintenance requirements during the closure and postclosure periods.

Point Ruston will be responsible for operations, maintenance and monitoring of the OCF during the closure and post-closure period.

TABLE 2-1 ESSENTIAL PROJECT ACTIONS AND PRIMARY ACTIVITIES

PROJECT DRIVER	ESSENTIAL PROJECT ACTIONS
Remedial Design/Remedial Action (RD/RA)	1.0 - On-site Containment Facility (OCF) 2.0 - Soil Removal and Replacement 3.0 - Grade, Terrace, and Cap Site 4.0 - Groundwater Monitoring and Control 5.0 - Shoreline Stabilization and Protection 6.0 - Surface Water Drainage and Control 7.0 - Demolition of Remaining Structures 8.0 - Breakwater Peninsula Remediation

2.1.2 Closure Certification and Post Closure Care of the OCF

Point Ruston must adhere to the applicable closure certification, monitoring, leachate collection, operation, maintenance and record keeping requirements of 40 C.F.R. §§ 264.310, 264.115, 264.116, 264.117, 264.118, 264.119 and 264.120 as included in the OCF Operations, Maintenance and Monitoring Plan. The post-closure period for the OCF shall continue in perpetuity. Leachate collection from the OCF must continue for as long as leachate is generated by the OCF.

2.2 GRADE, TERRACE AND CAP SITE (Primary Activity 3.0), DEMOLITION OF REMAINING STRUCTURES (Primary Activity 7.0) AND BREAKWATER PENINSULA REMEDIATION (Primary Activity 8.0)

Remedial Actions:

Cap the entire Smelter Site (Smelter soils and slag and the slag peninsula). The exception is the Stack Hill area where soils have been excavated to residential standards, and steep slope areas of Stack Hill which are too steep to cap. Place Ruston/North Tacoma residential soils over the contaminated soil/slag as a “sub-base” except over the OCF.

Demolish all of the remaining buildings and structures on the Smelter Site.

2.2.1 Design and Construction

Asarco is conducting the residential remediation in Ruston/North Tacoma. Soil from that remediation continues to be brought to the Smelter Site. Additional residential soils will be generated as the residential yard remediation is completed. Point Ruston shall allow remaining stockpiled residential soils, and remaining residential soils generated as yard remediation occurs to be placed on the Smelter Site until such time development of the Smelter Site, or EPA no longer allows it to continue.

Asarco has completed remediation of Stack Hill to residential standards in accordance with the Revised Work Plan for Excavation and Removal of Soils – Ruston and North Tacoma, Washington, December, 1994. The Stack Hill area does not require capping. Steep slopes along the eastern ravine side of Stack Hill have not been remediated to residential standards. These shall be addressed by Point Ruston through Institutional Controls (e.g., fencing) to restrict access per section 3.2 of the Revised Work Plan.

Asarco completed demolition of all buildings and structures on the Smelter Site with final demolition of the Fine Ore Bins building in 2004. Point Ruston shall demolish any remaining incidental objects during the completion of remediation (i.e. temporary water storage tanks, decon areas, temporary water treatment systems, etc.)

Point Ruston shall cap the entire Smelter Site including the slag peninsula with the exception of:

- the OCF;
- the Stack Hill area;

- areas on the property owned by Point Ruston where building foundations, roadways, parking lots, promenades and concrete walkways may be approved as the functional equivalent of the site cap; and
- other hard surfaces per design approved by EPA. .

The cap shall consist, from bottom of the cap to top, of a layer of dense (highly compacted) soil (soil excavated during the Ruston/North Tacoma residential Study Area site remediation may be used for this purpose) compacted to meet the standards in the remedial design, a physical marker layer designed to provide a visual indicator and some perforation protection, a 12-inch thick layer constructed of fine-grained, highly compacted cohesive soil, an additional 18- inch minimum layer of dense, clean cover soil, and at least 6 inches of clean topsoil and vegetation. As stated in Section 9.9 Performance Standards, of the OU2 ROD, “*Modifications of the cover system in areas where development will occur will need to be approved by EPA on a case-by-case basis.*” Point Ruston may submit a modified Remedial Design for approval by EPA. The proposed modifications will meet the performance standards in the ROD for the components being modified, and must not impact the ability of the other remedy components to meet the performance standards in the ROD.

The cap designed for the Slag Peninsula may be modified from a soil cap to incorporate solid structures (i.e. roads, buildings etc.) Point Ruston will not be required to implement a cap on the Slag Peninsula other than a soil cap, unless there is an EPA approved Operations and Maintenance Plan and an agreement approved by EPA for the long term implementation of the Operations and Maintenance Plan.

The Ruston car tunnel will be abandoned and filled to the extent practicable with suitable materials (e.g., residential soils) by Point Ruston. The ground surface over the car tunnel shall be capped.

2.2.2 Materials and Equipment

Point Ruston shall identify the materials and equipment that will be used during excavation, grading, terracing, and capping of the Smelter Site.

2.2.2.1 Grading and Contouring, Including Placement of Residential Soils as Sub-Base

Point Ruston shall grade and prepare the Smelter Site for capping, including construction of engineered fill or other geotechnical improvements determined necessary.

2.2.3 Cover System

Point Ruston must design and construct a cover system that meets the Performance Standards in the OU2 ROD. This layer must be constructed so that it will be entirely below the maximum depth of frost penetration upon completion of the cover system.

Point Ruston shall establish a construction quality assurance (CQA) program for the cover system to ensure that the constructed cover meets or exceeds all design criteria and specifications. Modifications of the cover system as it is described above to accommodate development will need to be approved by EPA.

2.2.4 Settling and Subsidence

Asarco has shown that there is little potential for settling or subsidence in areas of the Smelter Site that are to be capped. However, Point Ruston shall incorporate a plan which includes prevention of damage to cap and cover systems and minimizes settlement and subsidence of the cap (e.g., filling in voids, adequate compaction, pre-loading prior to cover placement, etc.) appropriate for the range of potential post-remediation uses in the Construction Quality Assurance Plan.

2.2.5 Steep Areas

Point Ruston, with EPA approval, shall identify if any areas on the Smelter Site that are too steep to cap. If any areas are identified, Point Ruston shall fence and plant low lying shrubs in these areas as required (e.g., the east and west gully slopes of the Stack Hill). Alternatives that are functionally equivalent for erosion and access control, as approved by EPA, may be implemented by Point Ruston if they are more practicable.

2.2.6 Disposal of Additional Ruston/North Tacoma Residential Soils

Residential soils will be placed as sub-grade at the Smelter Site as long as development allows. Point Ruston agrees to coordinate with EPA to allow onsite disposal until site development no longer makes it possible. .

2.2.7 Cap Maintenance, Including Post Closure Care

Point Ruston shall maintain the integrity and effectiveness of the final cover on its' owned property and on the soil cap on the Slag Peninsula, including conducting periodic inspections and making repairs to the soil cap as necessary to correct the effects of settling, subsidence, erosion, physical disturbances or other events. Point Ruston shall also prevent run-on and run-off from eroding or otherwise damaging the final cover. Point Ruston shall ensure that loading and stresses from future uses of the Smelter Site (e.g., roadways, walkways, buildings, parking lots, etc.) minimize any negative impact on cap integrity.

2.3 GROUNDWATER MONITORING AND CONTROLS (Primary Activity 4.0)

As required in the OU2 ROD Point Ruston will continue monitoring Smelter Site outfalls and SEAT stations at the Smelter Site. The monitoring program must be approved by EPA. At a minimum, four monitoring wells will be installed at the OCF , one upgradient and three downgradient, Outfall and seawater sample nearshore location (SEAT) stations will also be part of RA groundwater monitoring.

2.4 SHORELINE STABILIZATION AND PROTECTION (Primary Activity 5.0)

Remedial Action:

Determine the extent of shoreline erosion to determine where shoreline armoring should be placed, and anchor armoring on the slag face.

2.4.1 Design and Construction

Asarco completed shoreline armoring on the southern end of the Smelter Site from Station 10+00 to 28+35 and on the breakwater peninsula from station 50+36.3 to 71+56.25.

Armoring of the middle shoreline from station 28+35 to 50+36.3 still needs to be completed. Modifications to tie middle shoreline armoring in to the nearshore/offshore cap may be required.

Point Ruston shall complete construction of the middle shoreline armoring from Station 28+35 to 50+36.3 as designed by Asarco. If design of the nearshore/offshore sediment cap is modified, shoreline armoring will be modified as needed to tie armoring to the sediment cap. Point Ruston shall reinitiate ESA consultation with the natural resource agencies as appropriate. Point Ruston will not be continuing the shoreline armoring around the tip of the slag peninsula. In addition, Point Ruston will not be repairing the earthquake damage to the habitat basin.

2.4.2 Abandoned Structures and Debris

Point Ruston shall remove any remaining abandoned structures, debris and waste near the smelter middle shoreline as necessary for construction of new erosion control structures and/or repair of damaged or under-designed control structures. Disposal of this material will be consistent with the requirements of the Transport and Disposal Plan, Hydrometrics, September 1998.

2.4.3 Long-Term Maintenance (O&M)

Point Ruston shall maintain the shoreline armoring on its owned property in perpetuity and implement long term monitoring and maintenance as described in the Upland Operations, Maintenance and Monitoring Plan.

2.5 SURFACE WATER DRAINAGE AND CONTROLS (PRIMARY ACTIVITY 6.0)

Remedial Action:

Plug and abandon or remove the entire existing surface water drainage system and replace with a system compatible with post-remediation uses.

2.5.1 Design and Construction

Asarco completed removal of a significant portion of the existing surface water drainage system including plugging and abandoning the middle outfall.

Any remaining surface water drainage systems will require plugging and abandonment and a new system compatible with post-remediation use will have to be installed by Point Ruston.

Point Ruston shall plug the existing surface water inlets and outlets, and abandon or remove the surface water drainage system, and shall install a new drainage system, including outfall(s), in the Smelter Site cap to collect or divert water that runs onto the Smelter Site from the off-site drainage basins and from precipitation that originates on the Smelter Site. Point Ruston will abandon the north and south outfalls and associated drainage systems, and replace these outfalls with a new single combined outfall if approved by EPA.

Parametrix completed a preliminary review, as described in their memorandum dated February 21, 2006, which indicated flow capacity from the north and south outfalls could be combined into a new larger single outfall system with no reasonable potential to exceed water quality and sediment standards.

Point Ruston shall ensure that seeps on the Stack Hill and other areas of the Smelter Site are appropriately controlled so as not to contaminate the remediated Smelter Site. Point Ruston shall divert or treat (if required by permitting agencies or EPA) any off-site water that runs onto or through the owned property on the Smelter Site. Point Ruston shall comply with all applicable laws in controlling soil erosion and contaminated stormwater runoff including the use of best management practices (for example, sediment ponds, silt fences, diversion ditches, cut and fill slopes), to the extent practicable.

2.5.2 Management Including Diversion System

Point Ruston shall manage surface water, including stormwater, during the abandonment/removal of the remaining surface water drainage system. In addition, Point Ruston shall manage surface water generated from dust control activities during RA tasks in accordance with the Dust Control Plan.

Point Ruston shall design and implement a post-remediation water collection system for the Smelter Site which meets all state and local requirements. Point Ruston plans to divert offsite water from running onto the site. Therefore, storm water management will be concerned with onsite water. It is expected that water entering this system from the Smelter Site will not exceed applicable standards for Smelter Site contaminants. Therefore, this system shall be part of the improvements of the property and not part of the remediation, and permits will be required. EPA may revisit this requirement if in fact surface water does exceed applicable standards for site contaminants.

2.5.3 Materials and Equipment

In the Smelter Site design, Asarco identified the materials and equipment necessary to abandon/remove the existing drainage system and replace it with a new drainage system.

2.5.4 Long-Term Monitoring Requirements

Point Ruston shall monitor surface water quality during and after implementation of repair and replacement of the drainage system, soil removal, and capping as described in the RA Monitoring Plan and Upland Operations, Maintenance and Monitoring Plan. EPA may require Point Ruston to monitor the water quality of offsite flows diverted from the Smelter Site.

2.5.5 Long-Term Operation and Maintenance (O&M)

Point Ruston shall provide, either directly or through its successors-in-interest, for the maintenance in perpetuity of the surface water drainage system so that it remains in proper working condition. Maintenance shall include routine inspection and cleaning of catch basins, culverts, outfalls, and other components of the system.

2.5.6 Compliance with Performance Standards

Asarco was required to meet the Performance Standards for Smelter Site surface water set forth in Table 2-4 of the Asarco Final Statement of Work for the Commencement Bay Nearshore/Tideflats Superfund Site, an attachment to the 1996 Asarco Consent Decree unless they were modified by EPA. In response to the requirements of the SOW, Asarco prepared a Post-Remediation Surface

Water Evaluation and Technical Impracticability Demonstration Report to illustrate that remediation goals contained in Table 2-4 could not be met without substantial costs that would be disproportionate to the incremental environmental benefit of attaining them.

As part of the remedial design for OU6, Asarco also completed a reasonable potential analysis, detailed in the Pre-Final Design Analysis Report – Asarco Tacoma Smelter North and South Stormwater Marine Outfalls - June 2001, to evaluate the potential for concentrations of metals in the Smelter Site surface water to exceed Washington State marine water quality standards (WAC 173- 201A) when discharged from the proposed outfalls. The analysis determined that there is not a reasonable potential to exceed marine water quality standards for the four metals of concern (arsenic, copper, lead and zinc). The 2001 Report also evaluated the long-term potential for sediment recontamination and indicated no reasonable potential for surface water discharges to exceed the SQS in sediments.

Parametrix's memorandum dated February 21, 2006 summarized these analyses, provided the predicted water quality results and sediment recontamination potential, and evaluated the need for treatment of surface water runoff from the Smelter Site prior to Commencement Bay through the proposed outfalls. The memorandum concluded that previously proposed stormwater treatment systems are not necessary to protect water quality or marine sediments from adverse impacts from arsenic, copper, lead and zinc contained in surface water runoff.

Pending approval of the above memo and any additional submittals required by EPA to document that treatment is not required to meet all applicable standards, Point Ruston shall not be required to install treatment vaults to treat onsite surface water based on these analyses. Smelter Site surface water is expected to be clean and will fall under City of Tacoma outfall and stormwater management standards.

Additionally, any required future treatment of off-site water diverted from flowing through the Smelter Site shall not be the responsibility of Point Ruston. However, onsite, offsite, or groundwater which is discharged from outfalls on the Point Ruston owned property will be required to meet applicable standards.

2.5.7 Mixing Zone Identification

Asarco completed analyses to determine the need for a mixing zone in the PA 6 – Group 2b Preliminary Design Criteria Report, March 1998. The analysis included:

1. Demonstrating that all known, available and reasonable technology (AKART) has been either evaluated or implemented at the Smelter Site.
2. Providing the supporting information which clearly indicates that the mixing zone would not have a reasonable potential to cause a loss of sensitive or important habitat, substantially interfere with the existing or characteristic uses of the water body, result in damage to the ecosystem or adversely affect public health.

Asarco completed a pilot study to determine if the remediation goals (RGs) for the four “metals of concern” (arsenic, copper, lead, and zinc) could be met without a mixing zone. Based on results from the pilot study, it was recommended that the four “metals of concern” be analyzed for compliance with marine water quality standards within allowable acute and chronic mixing zones per WAC 173-201(A)-100. All other parameters listed in Table 1-1 of the Pre- Final Design Analysis Report – Asarco Tacoma Smelter North and South

Stormwater Marine Outfalls, Primary Activity 6 – Group 2b are expected to meet RGs. Point Ruston may construct new outfalls to incorporate mixing zones if allowable under state law.

2.6 WETLANDS IDENTIFICATION AND MITIGATION ACTIVITIES

Point Ruston shall conduct the mitigation activities described below for PAs 3.0/8.0 and 5.0 if EPA determines that wetlands or aquatic ecosystems are adversely impacted by the RA.

By providing this information in the SOW, EPA is in no way providing an *a priori* agreement that a proposed project which addresses the concerns listed here will be acceptable or that it would comply with Section 404 of the CWA. This decision will be made only after EPA performs the 404(b) (1) analysis and reviews public comments on the project following provision by Point Ruston of the necessary information.

These requirements are not intended to address any restoration activities which may be necessary to compensate for Natural Resource Damages under Section 107(f) of CERCLA.

Since guidance and policies pertaining to the discharge of dredged or fill material into the aquatic environment may change over time, Point Ruston must comply with current policies in place at the time the CD is executed by Point Ruston and EPA. Point Ruston will consult with EPA, the Corps of Engineers and resource agencies to obtain information applicable on that date.

2.6.1 Requirements for Wetlands Assessment

Point Ruston shall conduct all work in accordance with EPA's "Guidance on Considering Wetlands at Superfund Sites," May 9, 1994 (OSWER Directive Number 9280.0-03).

Point Ruston shall determine the potential impacts to wetlands from response actions in order to comply with the Clean Water. In addition, the extent of wetlands impacts and ecological structure of the impacted wetlands must be known when proposing and evaluating mitigation measures for wetlands impacts.

2.6.1.1 Requirements for Mitigation if there are Adverse Impacts to Intertidal Habitat or Wetlands

EPA will use the following EPA policies and guidance in evaluating proposals for discharge of dredged or fill material into the aquatic environment: Section 404 of the Clean Water Act (CWA), 22 U.S.C. 1251 *et seq.*, the CWA Section 404(b)(1) guidelines (40 C.F.R. Part 230), and the March 24, 1995, Site ROD.

Section 404 of the Clean Water Act allows for discharge of dredged or fill material into the aquatic environment only when it can be demonstrated that such a discharge will not have an unacceptable adverse impact, either individually or in combination with known and/or probable impacts of other activities affecting the ecosystems of concern. The intent of the CWA Section 404(b) (1) guidelines is to restore and maintain the chemical, physical, and biological integrity of waters of the United States through control of discharges of dredged or fill material.

If necessary, Point Ruston shall propose a compensation package that will adequately compensate for impacted resources. EPA's overall goal is to ensure no net loss of wetlands and aquatic sites. The compensation package shall account for both short-term temporary losses and for the proposed project's value to the ecosystem. In determining compensation, EPA will evaluate whether the project includes "restoration" of the function of a

previously existing habitat, “creation” of a new aquatic habitat from a non-aquatic area, or “enhancement” of the value of an existing aquatic habitat. EPA generally gives more mitigation “credit” for restoration (because new habitat is created and past experience shows a higher probability of success), and least “credit” for enhancement projects (which often involve exchanging one type of wetland habitat for another).

2.7 SURFACE AND GROUNDWATER MONITORING

Remedial Actions:

Monitor groundwater to evaluate the long-term effects that the Facility cleanup will have on the future groundwater quality.

Monitor surface water to ensure that the sediment cap is not recontaminated, and that surface water discharge requirements are met.

2.7.1 Implementation

Asarco will perform monitoring until the property sale. Point Ruston shall continue monitoring of the surface and groundwater in accordance with the RODs and approved designs and monitoring plans as part of post RA monitoring.

2.8 SEDIMENT CAPPING AND YACHT BASIN DREDGING

Remedial Actions:

Cap contaminated sediments in an approximate 18-acre area offshore of the former Asarco facility with clean fill

Excavate contaminated sediments in the Yacht Basin. Place sediments under the upland Smelter Site cap.

Point Ruston is required to install the 18-acre offshore cap. Point Ruston is required to implement a portion of the remedy for the Yacht Basin. As an interim measure for protection of public health, Point Ruston shall excavate the shallow nearshore sediments in the Yacht Basin as described below. They are not required to dredge the deep sediments in the Yacht Basin.

2.8.1 Design

The original design for the sediment cap and Yacht Basin was completed by Asarco and approved by EPA in 2004. There has been no progress made on implementation of this portion of the remedy.

Point Ruston may request that EPA allow changes to the approved sediment cap design. Any new cap design must meet the substantive requirements of the previous design as generally described in the “*Guidance for In-situ Subaqueous Capping of Contaminated Sediments*” (September 1998, Reference EPA 905-B6- 004). The cap design shall address the following factors:

- 1) Caps will have a minimum thickness of three (3) feet unless an alternative thickness is demonstrated to be consistent with “*Guidance for In-situ Subaqueous Capping of Contaminated Sediments,*” and/or otherwise approved by EPA.
- 2) Caps will be constructed to address adverse impacts through four primary functions:
 - a. Physical isolation of the contaminated sediment from ecological receptors;
 - b. Confinement and stabilization of contaminated sediments, preventing re-suspension and transport to other locations;
 - c. Reduction of chemicals transported through the groundwater pathway to levels that will not impact surface sediments (defined as the “biologically active zone” where most sediment-dwelling organisms live) above the CB N/T Sediment Quality Objective (SQOs), and will not impact surface water at levels exceeding background concentrations or marine chronic water quality criteria;
 - d. Provide a cap surface that promotes colonization by aquatic organisms, unless it is demonstrated not to be practicable.
- 3) Protectiveness of the proposed cap,
- 4) Compatibility with current and anticipated future land use,
- 5) Property owner’s (e.g., Washington Department of Natural Resources) willingness to implement use restrictions on the capped area and/or ensure such restrictions will run with the land,
- 6) Engineering constraints, and
- 7) Avoidance and/or minimization of habitat impacts and compliance with Endangered Species Act

Point Ruston shall demonstrate that all capped areas addressed under this SOW are completed in accordance with these performance standards. Point Ruston shall submit proposed alternatives to the final cap design as an amendment(s) for EPA review and approval. Methods for achieving the objectives for the capped areas shall be addressed in the amendment(s).

For the purpose of remediation under this SOW, dredging the shallow sediments in the Yacht Basin has been separated from the dredging of the deeper sediments in the Yacht Basin. As described below, Point Ruston shall implement the excavation of these shallow sediments. Remaining sediment remediation in the Yacht Basin shall not be the responsibility of Point Ruston and shall be addressed separately by others.

2.8.2 Construction

Point Ruston shall cap contaminated sediments in an approximate 18-acre area offshore of the former Asarco facility with clean fill. The sediment cap shall be tied into the shoreline armoring. As practicable, and as approved by EPA, Point Ruston shall meet performance standards at the completion of each sediment cap construction phase.

Point Ruston shall excavate the nearshore shallow sediments on the southwestern shoreline of the Yacht Basin which could be contacted by recreational users. Sediments shall be excavated above the MLLW tide line (0 MLLW) to a minimum depth of 12 inches. Excavation limits shall extend from the MLLW tide line to existing bulkhead or tidal grid at the northern end of the southwestern shoreline and from the MLLW tide to existing bulkhead, shoreline or tidal grid on the southern end of the southwestern shoreline. Existing bulkheads and tidal grids will not be removed.

The following information pertains to the shallow sediments in the Yacht Basin. Core sampling locations and results are summarized on Figure 1 of Appendix A to the Final Design Report for Sediment Dredging: Marine Sediments and Groundwater, Parametrix - June 2004. Confirmed depths of contamination between the MLLW tide line and the southwestern shoreline are 7 inches at the northern end and 5 inches on the southern end. Verification monitoring shall be completed for As, Cu, Pb, and Zn following excavation to determine if a second excavation cut is necessary to attain cleanup levels. Grab samples will be collected in the excavated areas and analyzed using either X-ray fluorescence or conventional wet-chemistry methods. Analytical results shall be provided to EPA. Backfilling or additional excavation of these areas will be required if the chemical performance standards for sediments or for residential exposure are not met.

2.8.3 Long-Term Maintenance (O&M)

Verification of performance standards shall be documented in the Construction Quality Assurance Project Plan (CQAP), as appropriate. Point Ruston shall conduct monitoring of the cap area following placement in order to determine the success of the remedial action. Long-term monitoring shall be conducted on the sediment cap to confirm that it remains in place, continues to isolate the underlying contaminated sediments and does not become recontaminated with site contaminants. After Point Ruston completes construction of the sediment cap required in a Phase and EPA issues a Certification of Completion for that Phase, Point Ruston shall no longer be required to meet Performance Standards with respect to the capped sediments (including making repairs to correct the effects of recontamination, settling, subsidence, erosion, physical disturbances, or other forces); provided however, that if the sediment cap does not meet Performance Standards at the completion of the Remedial Action, then EPA may withdraw its Certification(s) of Completion for the cap until either (i) Point Ruston demonstrates that its actions were not responsible for the cap no longer meeting Performance Standards, or (ii) Point Ruston takes those actions necessary to again meet Performance Standards.

2.9 OTHER ACTIONS

2.9.1 Comprehensive Plans and Documents

Comprehensive Plans and Documents (CP&D) are plans and documents that have application to all Remedial Design/Remedial Action PAs because they are the control documents that, in addition to design deliverables, describe how RD/RA activities will be conducted at the Smelter Site. The following CP&Ds were prepared by Asarco as part of Remedial Design and will be edited as necessary, and implemented by Point Ruston for the remaining remediation tasks:

- Sampling and Analysis Plans (SAP);
 - Field Sampling Plans (FSP);
 - Quality Assurance Project Plans (QAPP);
- Health and Safety Plans (HSP);

- Fire Protection Plans (FPP); and
- Operations and Maintenance Plans (O&M).

2.9.2 Integrating Remediation with Land Use Plans.

Consistent with the institutional control provisions of the CD, Point Ruston shall develop an enforceable program of private restrictions and guidelines to supplement the actual remediation activities. Such measures are necessary to ensure that development activities do not have an impact on the long-term effectiveness of the remediation.

The Institutional Controls shall integrate remediation with future land uses by developing institutional controls that ensure that: (1) the integrity of the remediation activities is continued; (2) future remediation measures will not be prevented or hindered by future entities in the developed area; (3) little or no remaining contaminants of concern are exposed or released during future (postremediation) excavation; and (4) the use of groundwater at the Smelter Site will be prohibited and markers or signs for future users and occupiers of the Smelter Site will be provided.

Asarco prepared the OCF Operations, Maintenance and Monitoring Plan (OCF OMMP) that shall be implemented by Point Ruston or its successors to ensure the continued integrity of the OCF. Point Ruston shall prepare an Upland Operations, Maintenance and Monitoring Plan (Upland OMMP) which addresses the Smelter Site cap, shoreline armoring, sediment cap monitoring, and groundwater and surface water monitoring requirements. Point Ruston shall be responsible for monitoring activities including regularly scheduled inspections of the Smelter Site cap, the OCF, and shoreline armoring on its' owned property. In addition, Point Ruston is responsible for monitoring the sediment cap, and maintenance of the soil cap on the Slag Peninsula. Maintenance activities on Point Ruston's owned property shall include repair of damage to, or failures of, the Smelter Site cap, the OCF, and shoreline armoring.

Point Ruston shall comply with established guidelines for conducting construction and maintenance activities to ensure that little or no remaining contamination is exposed or released during future (post-remediation) excavation and ensure that such guidelines shall be enforceable against all successors-in-interest that own, construct or operate building or other structures at the Smelter Site. EPA approval shall be required for any activity that may disturb the integrity of the Smelter Site cap, the OCF or shoreline armoring.

The OCF OMMP and Upland OMMP include guidelines to identify the appropriate actions if an exposure or release of contaminated soil and/or granular fill occurs (e.g., define each party's responsibility for disposal of soil). Activities addressed by these procedures will include installation of underground utilities, basements or elevator shafts, and roadways. The Upland OMMP includes a soil collection, transportation, and disposal program to apply when soil below the Smelter Site cap is excavated or exposed.

Point Ruston shall develop public educational materials and markers or signs for future users and occupiers of the Smelter Site. All material must be reviewed and approved by EPA. The materials and markers or signs will describe the remediation and explain what the users and occupiers should and should not do to maintain the effectiveness of the remediation. In addition, material prepared for occupants on the Smelter Site must include information on the following:

- Future Smelter Site maintenance, and requirements for future funding of the Operation and Maintenance

- Sequencing of the remediation and timeline for completion

EPA reserves the right to ensure that future remedial measures will not be prevented or hindered by development activities, including the setting aside of a portion of the Smelter Site for remediation of groundwater or surface water if necessary.

2.9.3 Community Relations

Asarco prepared the Community Health and Safety Plan/Coordination Plan, revised May 2001. Point Ruston shall continue to implement this plan during remaining remediation tasks. This program was established to ensure coordination and communication of remediation activities and schedules, road closures, and other activities and conditions that should be expected in the community during remediation activities, and any recommended safeguards or precautions. While Point Ruston maintains their lease area in the "Ruston School", Point Ruston shall provide EPA with space for oversight activities, and space for operation of the Asarco Information Center.

2.9.4 Road Closures

In the event that it will be necessary to close roads at or near the Smelter Site during any portion of remediation activities, Point Ruston shall coordinate with the Town of Ruston and City of Tacoma regarding alternative routes and notification procedures.

2.9.5 Safety Measures

On-site activities throughout implementation of the selected remedy shall comply with all appropriate occupational health and safety regulations including 29 C.F.R. §§ 1910.120 and 1926 as described in the Construction Health and Safety Plan/Contingency Plan and Community Health and Safety Plan/Coordination Plan prepared by Asarco.

2.9.6 Air Monitoring

During remediation, Point Ruston shall ensure that no visible dust is present during excavation activities. In addition, Point Ruston shall evaluate potential emissions of contaminants into the ambient air as a result of implementation of the remaining remedial action tasks. All sampling and data gathering methods to be used must be described in detail, including sampling, frequency of testing, acceptance/rejection criteria, turn-around time, and plans for correcting problems. Hi-vol and PM10 air particulate or, if approved by EPA, portable air samplers consisting of battery powered pumps equipped with cellulose ester filter cassettes shall be placed at locations approved by EPA and used to confirm that the incremental levels identified in Table 2-5 are not exceeded. Air monitoring requirements will be discontinued once the Smelter Site cap is in place. If approved by EPA, offsite air monitoring may be discontinued once the temporary cap is in place. However, onsite monitoring may be required to ensure development areas are not impacted by remediation.

TABLE 2-2 AIR MONITORING ACTION LEVELS

Air Monitoring Action Levels	
Parameter	ug/m³
Arsenic	0.2
Lead	0.75
PM ₁₀	75

2.9.7 Dust Control

In order to minimize the potential for dust emissions to the extent practicable, Point Ruston shall wet key traffic areas and roads used for the remedial action; use dust suppression agents (wetting agents or polymer); decontaminate vehicles at designated truck washing stations prior to using off-site roads; cover trucks containing hazardous materials (e.g., stack bricks) and use dust suppression on off-site roadways, if necessary.

2.9.8 Transportation and Decontamination

Point Ruston shall continue to implement the Transport and Disposal Plan prepared by Asarco in September 1998 and included in Volume I of the Comprehensive Plans and Documents. This plan was written to establish local truck routes to minimize, to the extent practicable, disruption to the community. This plan also identifies damage control measures and responsibility for repairing existing roadways in the event that they are degraded or damaged solely by remedial action activities. In addition, Point Ruston shall continue to implement the Decontamination Plan prepared by Asarco and included in section 5 of the Construction Health and Safety Plan/Contingency Plan, Revision 1, May 2001.

2.10 COMPLIANCE WITH THE PERFORMANCE STANDARDS

Point Ruston shall perform compliance testing to ensure that all Performance Standards are met for all remaining elements of the selected remedies described in the ROD and performed by Point Ruston. In addition, for property owned by Point Ruston, Point Ruston shall perform compliance testing to ensure that all Performance Standards in the ROD are met. By meeting the Performance Standards for all elements of the selected remedy described in the ROD, including operation and maintenance and monitoring requirements, the overall cancer risk and hazard index for the Smelter Site as set out in the ROD shall be considered met.

Remediation of subsurface groundwater is specifically excluded from the scope of the remedy selected in the ROD. Therefore, the Performance Standards do not include the preliminary remediation goals for Class III groundwater set out in Table 9-2 of the ROD.

2.11 SEQUENCING OF DEVELOPMENT AND OCCUPANCY

Point Ruston shall submit a plan for EPA approval describing the sequence for completion of the elements of the remedial action and plans for Smelter Site development and occupancy. The purpose of this plan is to allow for the development of the property before the completion of Smelter Site capping, while ensuring that ongoing construction activities will not create a health hazard for future occupants of the property. Protective measures will include buffer zones between existing units and construction. In addition, an EPA approved temporary cap composed of a marker, and clean soil covered with vegetation, or an alternate design approved by EPA will be required over the entire Smelter Site prior to first occupancy.

3.0 SCOPE OF THE REMEDIAL DESIGN AND REMEDIAL ACTION

Point Ruston shall utilize existing work plans and related documents, in whole or part, as may be applicable to each phase of remaining design and construction. Asarco prepared the Comprehensive Plans and Documents for the Smelter Site including Sampling and Analysis Plans (SAPs), Quality Assurance Project Plans (QAPPs), Health and Safety Plans (HSPs), Fire Protection Plans (FPPs) and other required documents with site-wide applicability. Point Ruston shall continue to implement these plans as applicable.

Point Ruston shall perform and shall assume all responsibility for the accuracy and completeness of any remaining design work and services for the described project in accordance with Performance Standards, criteria, and instructions as described in this SOW. Point Ruston shall be responsible for the correction of any design errors or deficiencies in their work. Should design changes as a result of revised criteria be required, EPA may instruct Point Ruston to perform the necessary redesign work. EPA shall consider any necessary schedule revisions, including suspension of activities without penalty, should any design changes result from revised criteria.

When submitting project deliverables to EPA, Point Ruston shall resolve apparent deficiencies, ambiguities, conflicts and inconsistencies in the documents. A letter of transmittal shall be signed by the authorized representative of Point Ruston. In the event that discrepancies, omissions, or other errors in the drawings and specifications are discovered after final design document submission, Point Ruston shall review the specifications and/or contract drawings or prepare sketches and provide the necessary data.

3.1 REMEDIAL DESIGN

Asarco substantially completed Remedial Design for the Smelter Site. Point Ruston shall submit revised plans and specifications for modifications to the remaining remediation tasks as required for EPA review and approval (e.g., site cap, outfall design).

Point Ruston shall also submit final drafts of the Construction Management Plan and Construction Quality Assurance Plan/Performance Standards Verification Plan for PA 3 & 8 to EPA for review and approval.

1. Construction Management Plan.

A Construction Management Plan shall be developed to indicate how the construction activities are to be implemented and coordinated with EPA during the remaining RA. Point Ruston shall designate a person to be a Remedial Action Coordinator and its representative on-site during the Remedial Action, and identify this person in the Plan.

2. Construction Quality Assurance Project Plan/Performance Standard Verification Plan.

Point Ruston shall develop and implement a Construction Quality Assurance Project Plan for the Smelter Site cap (PA 3 & 8) to ensure, with a reasonable degree of certainty, that the completed Remedial Action meets or exceeds all design criteria, plans and specifications, and Performance Standards.

As stated previously in section 3.0, Point Ruston shall continue to implement existing work plans and related documents prepared by Asarco, in whole or part, as may be applicable to each phase of remaining design and construction. If required, due to design changes or revised monitoring requirements, Point Ruston will submit addenda to the plans, specifications, or Comprehensive Plans and Documents for EPA review and approval.

Point Ruston shall provide all future land use plans, including all submissions to other agencies for purposes of obtaining permits or other approvals, to EPA as they become available.

3.2 REMEDIAL ACTION

Remedial Action shall be performed by Point Ruston to implement the remaining response actions outlined in this SOW. Remaining remediation tasks are described in Asarco prepared documents, and may be amended in future EPA approved amendments prepared by Point Ruston, these include:

- the Upland Final Design prepared by Asarco and amendments to that design prepared by Point Ruston and submitted to EPA for review and approval; and
- The Final Design Report for Sediment Cap: Marine Sediment and Groundwater prepared by Asarco and amendments to that design prepared by Point Ruston and submitted to EPA for review and approval. Point Ruston will incorporate excavation of the nearshore shallow sediments on the southwestern shoreline of the Yacht Basin above the tideline (0 MLLW) to the limits of the tidal grid at a minimum depth of 12 inches in the amendment to the Sediment design.

Point Ruston shall implement the remaining Remedial Action in accordance with the approved Final Construction schedule. Significant field changes to the RA as set forth in the Final Design for each PA shall not be undertaken without the approval of EPA. The RA shall be documented in enough detail to produce asbuilt construction drawings after the RA is complete. Deliverables shall be submitted to EPA for review and acceptance in accordance with paragraph 31 and Section XI of the CD.

3.2.1 Remedial Action Construction

As outlined in the amended CD, Point Ruston plans on completing the remedial action in Phases which are subject to EPA approval. For the purpose of obtaining a certification of completion for remedial activities not associated with the remediation of the upland property purchased by Point Ruston, capping the offshore sediments and capping the Slag Peninsula may be considered Phases so that they may receive certificates of completion without an associated Smelter Property completion. Unless otherwise approved by EPA, EPA will only issue two certifications of completion for the sediment cap, one for the sand/silt cap, and one for the cap between the sand/silt cap and shoreline armoring.

Point Ruston shall implement the remaining Remedial Action as detailed in the approved Final Design and approved amendments prepared by Point Ruston. The following activities shall be completed in constructing the Remedial Action.

1. Preconstruction Phase Conference.

A Preconstruction Phase Conference shall be held before initiation of each Phase of construction activities. This conference shall include Point Ruston and federal, state and local government agencies as required and shall address the remedial action components of the Phase.

The Preconstruction Phase Conference must be documented, including names of people in attendance, issues discussed, clarifications made, special instructions issued, and so forth.

2. Pre-Final Phase Construction Inspection.

Upon preliminary completion of the RA for each Phase, Point Ruston shall notify EPA for the purpose of conducting a Pre-Final Construction Inspection for said Phase or logical subunit of the Phase. Participants may include the other federal, state, and local agencies with a jurisdictional interest. The Pre-Final Inspection shall consist of a walk-through inspection of the Smelter Site specific to the Phase. The objective of the inspection is to determine whether the construction is complete and consistent with the Performance Standards and design requirements for the Phase or logical subunit of the Phase. Any incomplete construction items discovered during the inspection shall be identified and noted. The Pre-Final Construction Inspection Report for each Phase or logical subunit of the Phase shall be submitted by Point Ruston in a memorandum which outlines the outstanding construction items, actions required to resolve the items, completion date for the items, and an anticipated date for the Final Inspection.

3. Final Phase Construction Inspection.

Upon completion of all outstanding construction items for a Phase, Point Ruston shall notify EPA for the purpose of conducting a Final Construction Inspection. The Final Construction Inspection shall consist of a walk-through inspection of the Site specific to the Phase. The Pre-Final Construction Inspection Report shall be used as a check list with the Final Construction Inspection focusing on the outstanding construction items identified in the Pre-Final Construction Inspection. All tests that were originally unsatisfactory shall be conducted again. Confirmation shall be made during the Final Construction Inspection that all outstanding items have been resolved. Any outstanding construction items discovered during the inspection still requiring correction shall be identified and noted. If any items are still unresolved, the inspection shall be considered to be a Pre-Final Construction Inspection requiring another Pre-Final Construction Inspection Report and subsequent Final Construction Inspection.

4. Final Phase Construction Report/Remedial Action Report.

Within thirty (30) days following the conclusion of the Final Construction Inspection for each Phase, Point Ruston shall submit a Draft and then Final Construction Report for each Phase. EPA will review the draft report and will provide comments to Point Ruston. The Final Construction Report for each Phase shall include the following:

- a) Brief description of how outstanding items noted in the Prefinal Inspection were resolved;

- b) Explanation of any modifications made during the RA to the original design plans and why these changes were made;
- c) As-built drawings;
- d) Synopsis of the construction work defined in the SOW and certification that the construction work has been completed; and
- e) Final Construction Quality Assurance Project Plan Report. At the completion of the project, Point Ruston shall submit a final report to EPA. This report should include all of the daily inspection reports, the daily manufacture quality assurances/construction quality assurances (MQA/CQA) engineer's summary reports, inspection data sheets, problem identification and corrective measures reports, and other documentation such as quality control data provided by manufacturers or fabricators, laboratory test results, photographs, as-built drawings, internal MQA/CQA memoranda or reports with data interpretation or analyses, and design changes made by the design engineer during construction. The document should be certified by the MQA/CQA certifying engineer.
- f) Certification that the Remedial Action for the Phase has been completed in full satisfaction of the requirements of the CD.

3.2.2 Final Certification

Within thirty (30) days following conclusion of the final Phase, Point Ruston shall submit certification that the Remedial Action for all Phases has been completed in full satisfaction of the requirement of the RODs and CD.

4.0 REFERENCES

The following list, although not comprehensive, comprises many of the guidance documents that apply to the RD/RA process. Point Ruston shall review the following guidance and shall use the information provided therein as applicable in performing the RD/RA and preparing all deliverables under this SOW.

ATTACHMENT 1

Remediation Milestone Schedule

Milestone	Required Completion Date
Nearshore/Offshore Sediment Sand/Silt Cap (approx. 10.5 acres)	Complete.
Cap Slag Peninsula	Complete.
Construction of temporary site cap	Complete.
Excavation of shallow sediments in Yacht Basin per SOW requirements	No later than October 31, 2017
Complete Sediment Cap	Complete.
Remaining Site Cap – 3 parcels complete	No later than December 31, 2017.
Remaining Site Cap 6 parcels complete	No later than December 31, 2018.
Remaining Site Cap 7 parcels complete	No later than December 31, 2019.
Complete Site Cap on MMZ Area.	No later than December 31, 2020, unless the Material Management Zone (“MMZ”) area is under active development pursuant to an approved CMP and remains uncapped, then the MMZ shall have a completed cap completed pursuant to the schedule authorized under such CMP.
Submit a groundwater monitoring plan	On or before June 15, 2016, with monitoring beginning no later than 30 days after EPA’s approval of the plan.

Appendix G

GUARANTEE AGREEMENT

This GUARANTEE AGREEMENT, (this "Guarantee"), is made by Michael A. Cohen; Kenneth J. Thomsen and Kathryn Thomsen, and the marital community composed thereof; and MC Construction Consultants Inc. ("Guarantors"), to and for the benefit of the United States Environmental Protection Agency, an agency of the federal government of the United States of America ("EPA"). This Guarantee is made on behalf of Point Ruston, LLC ("Settling Defendant").

RECITALS

WHEREAS, pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act of 1980, as amended, 42 U.S.C. § 9601 et seq. ("CERCLA"), and the Resource Conservation and Recovery Act, as amended, 42 U.S.C. § 6901 et seq. ("RCRA"), EPA entered into a Consent Decree with Asarco Incorporated ("Asarco"), in *United States of America v. Asarco Incorporated*, Civil Action No. C91-5528 B (Western District of Washington) (the "Consent Decree"), for certain environmental remediation work to be performed at the Asarco Tacoma Smelter site (the "Site") in Ruston and Tacoma, Washington. EPA and Settling Defendant negotiated an amendment to the Consent Decree (the "Second Amendment"), which has been amended and fully superseded by the Third Amended Consent Decree ("Third Amended Consent Decree");

WHEREAS, Paragraph 62 of the Third Amended Consent Decree requires that Settling Defendant provide financial assurance to EPA that funds or other resources will be available as and when needed to ensure completion of the Work required to be conducted by Settling Defendant under the Third Amended Consent Decree;

WHEREAS, in order to provide part of such financial assurance required by the Third Amended Consent Decree, Settling Defendant has agreed to provide EPA with a guarantee, issued by Guarantors, of Settling Defendant's obligations arising under the Third Amended Consent Decree, all as set forth more fully in this Guarantee;

WHEREAS, Guarantors have a substantial financial interest in Settling Defendant, and the Guarantors will receive substantial benefits from the agreements made by and between EPA and Settling Defendant as set forth in the Third Amended Consent Decree; and

WHEREAS, Guarantors have agreed to, among other things, guarantee payment and performance in full of the Guaranteed Obligations (as hereinafter defined) and undertake such other commitments to EPA or for EPA's benefit as set forth in this Guarantee.

AGREEMENT

NOW, THEREFORE, in consideration of the promises contained herein, and to induce EPA to enter into the Third Amended Consent Decree and to settle with Settling Defendant under CERCLA and RCRA as contemplated thereby, and for other good and valuable consideration, the receipt and adequacy of which are hereby acknowledged, Guarantors hereby agree with EPA as follows:

ARTICLE I.
DEFINITIONS

1.1 Defined Terms. The following terms (whether or not underscored) when used in this Guarantee, including its preamble and recitals, shall have the following meanings:

“Affiliate” means, when used with respect to a specified entity, another entity that directly, or indirectly through one or more intermediaries, Controls or is Controlled by or is under common Control with the entity specified. “Control” means the possession, directly or indirectly, of the power to direct or cause the direction of the management or policies of an entity, whether through the ownership or control of voting securities, partnership interests or other equity interests, by contract, or otherwise, and “Controlling” and “Controlled” shall have meanings correlative thereto.

“EPA” has the meaning given in the preamble to this Guarantee.

“Guaranteed Obligations” means and includes all obligations and liabilities, howsoever arising, owed by Settling Defendant to EPA of every kind and description (whether or not for the payment of money), direct or indirect, absolute or contingent, due or to become due, now existing or hereafter arising, pursuant to the terms of the Third Amended Consent Decree.

“Guarantors” has the meaning given in the preamble to this Guarantee.

“Guarantee” has the meaning given in the preamble to this Guarantee.

“Site” has the meaning given in the preamble to this Guarantee.

1.2 General Definitions. Unless otherwise defined herein or unless the context otherwise requires, capitalized terms used in this Guarantee, including its preamble and recitals, have the meanings provided in the Third Amended Consent Decree.

ARTICLE II.
GUARANTEE

2.1 Guarantee.

(a) Guarantors, as primary obligors and not merely as surety, hereby unconditionally and irrevocably guarantee to EPA the prompt payment in full and the prompt performance in full of the Guaranteed Obligations.

(b) Guarantors agree that if for any reason Settling Defendant shall fail to pay or perform, as the case may be, when due any of the Guaranteed Obligations, Guarantors shall, upon demand by EPA, promptly pay or perform, as the case may be, the same forthwith on the date such payment or performance of such Guaranteed Obligation is due or required, without regard to any exercise or non-exercise by Guarantors, Settling Defendant, or EPA of any right, remedy, power or privilege under or in respect of the Third

Amended Consent Decree, and that in the case of any extension of time of the payment, performance, or renewal of any of the Guaranteed Obligations, the same will be promptly paid or performed, as the case may be, in full when due in accordance with the terms of such extension or renewal.

(c) Without limiting the foregoing, Guarantors acknowledge and agree that, upon the occurrence and during the continuance of a "Work Takeover" as specified in Paragraph 102 of the Third Amended Consent Decree, at the election of EPA, Guarantors shall immediately upon written demand from EPA deposit into an account specified by EPA, in immediately available funds and without setoff, counterclaim, or condition of any kind, a cash amount up to but not exceeding the estimated cost of the remaining Work to be performed as of such date, as determined by EPA. Any dispute of EPA's determination of the estimated costs of the remaining Work to be performed shall be resolved pursuant to Paragraph 83 of the Third Amended Consent Decree.

2.2 Obligations Absolute and Unconditional.

(a) The obligations of Guarantors hereunder are primary obligations of Guarantors and constitute an absolute, unconditional, continuing and irrevocable guarantee of payment and performance of the Guaranteed Obligations and the other obligations of Guarantors hereunder and not of collectibility, and are in no way conditioned on or contingent upon any attempt to enforce in whole or in part Settling Defendant's liabilities and obligations to EPA. Each failure by Guarantors to pay or perform, as the case may be, a Guaranteed Obligation or any other obligation hereunder shall give rise to a separate cause of action hereunder, and separate suits may be brought hereunder as each cause of action arises.

(b) EPA may, at any time and from time to time (whether or not after revocation or termination of this Guarantee) without the consent of or notice to Guarantors, except such notice as may be required by the Third Amended Consent Decree or applicable law which cannot be waived, without incurring responsibility to Guarantors, without impairing or releasing the obligations of Guarantors hereunder, upon or without any terms or conditions and in whole or in part:

(i) change the manner, place and terms of payment or performance of, or renew or alter, any Guaranteed Obligation or any obligations and liabilities (including any of those hereunder) incurred directly or indirectly in respect thereof or hereof, or in any manner modify, amend or supplement the terms of the Third Amended Consent Decree or any documents, instruments or agreements executed in connection therewith, in each case with the consent of Settling Defendant (in each case, as and to the extent required by the Third Amended Consent Decree), and the agreements and guarantees herein made shall apply to the Guaranteed Obligations or such other obligations as changed, extended, renewed, modified, amended, supplemented or altered in any manner;

(ii) exercise or refrain from exercising any rights against Settling Defendant or others (including Guarantors) or otherwise act or refrain from acting;

(iii) add or release any other guarantor from its obligations without affecting or impairing the obligations of Guarantors hereunder;

(iv) settle or compromise any Guaranteed Obligations or any obligations and liabilities incurred directly or indirectly in respect thereof;

(v) consent to or waive any breach of, or any act, omission or default under, the Amended Consent Decree or otherwise amend, modify or supplement (with the consent of Settling Defendant, as and to the extent required by the Third Amended Consent Decree) the Amended Consent Decree or any of such other instruments or agreements; and/or

(viii) act or fail to act in any manner referred to in this Guarantee which may deprive Guarantors of their right to subrogation against Settling Defendant to recover full indemnity for any payments or performances made pursuant to this Guarantee or of its right of contribution against any other party.

(c) No invalidity, irregularity or unenforceability of the Guaranteed Obligations or invalidity, irregularity, unenforceability or non-perfection of any collateral Therefor shall affect, impair or be a defense to this Guarantee, which is a primary obligation of Guarantors.

(d) This is a continuing Guarantee and all obligations to which it applies or may apply under the terms hereof shall be conclusively presumed to have been created in reliance hereon. In the event that, notwithstanding the provisions of Section 2.2(a) above, this Guarantee shall be deemed revocable in accordance with applicable law, then any such revocation shall become effective only upon receipt by EPA of written notice of revocation signed by Guarantors. To the extent permitted by applicable law, no revocation or termination hereof shall affect, in any manner, rights arising under this Guarantee with respect to Guaranteed Obligations arising prior to receipt by EPA of written notice of such revocation or termination. Any such revocation or termination without EPA's prior written consent shall be deemed to be a violation of the Amended Consent Decree.

ARTICLE III. REPRESENTATIONS AND WARRANTIES

3.1 Guarantors' Representations and Warranties. Guarantors represent and warrant to and in favor of EPA, as of the date of this Guarantee, that:

3.1.1 No Conflict. The execution, delivery and performance by Guarantors of this Guarantee and the execution, delivery, and performance by Settling Defendant of the Third Amended Consent Decree do not and will not (a) violate any provision of (i) any legal

requirement applicable to Guarantors or (ii) any order, judgment or decree of any court or agency or governmental instrumentality binding on Guarantors, (b) conflict with, result in a breach of, or constitute a default under any material contractual obligation of Guarantors, (c) result in or require the creation or imposition of any lien upon any of the properties or assets of Guarantors, or (d) require any approval or consent of any person or entity, except for such approvals or consents which will be obtained on or before the date of this Guarantee and which have been disclosed in writing to EPA.

3.1.2 Enforceable Obligations. This Guarantee constitutes a legal, valid and binding obligation of Guarantors, enforceable in accordance with its terms, except to the extent that enforceability may be limited by applicable bankruptcy, insolvency, or other similar laws affecting the enforcement of creditors' rights generally.

3.1.3 Compliance with Law; Fraud.

(a) Guarantors (i) are not in violation of any applicable legal requirements in any material respect and (ii) are not subject to or in default in any material respect with respect to any final judgments, writs, injunctions, decrees, rules or regulations of any court or any federal, state, municipal or other governmental department, commission, board, bureau, agency or instrumentality, domestic or foreign, in the case of either (i) or (ii) which would have a material adverse effect on the ability of Guarantors to perform their obligations under this Guarantee.

(b) Guarantors are not executing this Guarantee with any intention to hinder, delay or defraud any present or future creditor or creditors of Guarantors.

3.1.4 Relationship To Settling Defendant. Guarantors have a "substantial business relationship" (as defined in 40 C.F.R. § 264.141(h)) with Settling Defendant.

3.1.5 No Bankruptcy Filing. Guarantors are not contemplating either the filing of a petition under any state or federal bankruptcy or insolvency laws or the liquidation of all or a major portion of its assets or property, and Guarantors have no knowledge of any person contemplating the filing of any such petition against them.

ARTICLE IV.
COVENANTS

Guarantors hereby covenant and agree for the benefit of EPA, until this Guarantee is terminated pursuant to Section 6.16, as follows:

4.1 Compliance with Laws. Guarantors shall promptly comply, or cause compliance, in all material respects with all legal requirements to the extent any noncompliance with such legal requirements could have a material adverse effect on the ability of Guarantors to perform and discharge their obligations under this Guarantee.

4.2 Notice of Bankruptcy or Insolvency, Etc. Guarantors shall notify EPA within 10 days after the occurrence of any of the following: filing by any Guarantor of a petition seeking to take advantage of any laws relating to bankruptcy, insolvency, or composition or adjustment of debts; any Guarantor's consent to (or failure to contest in a timely manner) any petition filed against it in an involuntary case under such bankruptcy or other laws; any Guarantor's application for (or consent to or failure to contest in a timely manner) the appointment of, or the taking of possession by, a receiver, custodian, trustee, liquidator, or the like of all or a substantial part of its assets; or any Guarantor's making a general assignment for the benefit of creditors.

4.3 Further Assurances. Guarantors shall promptly provide EPA with such information and other documents related to this Guarantee and the Guaranteed Obligations that EPA may reasonably request.

ARTICLE V.
SUBROGATION; ETC.

5.1 Waiver. Guarantors hereby unconditionally and irrevocably waive and relinquish, to the maximum extent permitted by applicable legal requirements, all rights and remedies accorded to sureties or guarantors and agree not to assert or take advantage of any such rights or remedies, including:

(a) any right to require EPA to proceed against Settling Defendant or any other person or to pursue any other remedy in EPA's power before proceeding against Guarantors;

(b) any defense that may arise by reason of the incapacity, lack of power or authority, dissolution, merger, or termination of Guarantors, Settling Defendant, or any other person or the failure of EPA to file or enforce a claim against the estate (in administration, bankruptcy or any other proceeding) of Guarantors or Settling Defendant, or any other person;

(c) promptness, diligence, demand, presentment, protest and notice of any kind, including notice of the existence, creation or incurring of any new or additional indebtedness or obligation or of any action or non-action on the part of Settling Defendant or EPA;

(d) any defense based upon an election of remedies by EPA, which destroys or otherwise impairs the subrogation rights of Guarantors, the right of Guarantors to proceed against Settling Defendant or another person for reimbursement, or both;

(e) any defense based on any offset against any amounts which may be owed by any person to Guarantors for any reason whatsoever;

(f) any defense based on any act, failure to act, delay or omission whatsoever on the part of Settling Defendant or the failure by Settling Defendant to do any act or thing

or to observe or perform any covenant, condition or agreement to be observed or performed by it under the Third Amended Consent Decree;

(g) any defense based upon any statute or rule of law which provides that the obligation of a surety must be neither larger in amount nor in other respects more burdensome than that of the principal;

(h) any defense, setoff or counterclaim which may at any time be available to or asserted by Settling Defendant against EPA or any other person under the Third Amended Consent Decree;

(i) any duty on the part of EPA to disclose to Guarantors any facts EPA may now or hereafter know about Settling Defendant or the Site, regardless of whether EPA has reason to believe that any such facts materially increase the risk beyond that which Guarantors intend to assume, or have reason to believe that such facts are unknown to Guarantors, or have a reasonable opportunity to communicate such facts to Guarantors, since Guarantors acknowledge that Guarantors are fully responsible for being and keeping informed of the financial condition of Settling Defendant and of all circumstances bearing on the risk of nonpayment or non-performance of any Guaranteed Obligation;

(j) any defense based on any change in the time, manner or place of any payment or performance under, or in any other term of, the Third Amended Consent Decree, or any other amendment, renewal, extension, acceleration, compromise or waiver of or any consent or departure from the terms of the Third Amended Consent Decree; and

(k) any right to assert the bankruptcy or insolvency of Settling Defendant or any other person as a defense hereunder or as the basis for rescission hereof and any defense arising because of EPA's institution of any proceeding under the Federal Bankruptcy Code.

5.2 Subrogation. Until this Guarantee is terminated in accordance with Section 6.16 below, neither Guarantors nor Settling Defendant shall exercise any right of subrogation or enforce any remedy which they now may have or may hereafter have against any person in respect of the Guaranteed Obligations, whether or not such claim, right or remedy arises in equity, under contract, by statute, under common law or otherwise.

5.3 Bankruptcy.

(a) The obligations of Guarantors under this Guarantee shall not be altered, limited or affected by any proceeding, voluntary or involuntary, involving the bankruptcy, reorganization, insolvency, receivership, liquidation or arrangement of Settling Defendant or any Affiliate thereof, or by any defense which Settling Defendant or any Affiliate thereof may have by reason of any order, decree or decision of any court or administrative body resulting from any such proceeding.

(b) Guarantors hereby irrevocably waive, to the extent they may do so under applicable legal requirements, any protection against enforcement of this Guarantee to

which they may be entitled under the Federal Bankruptcy Code or equivalent provisions of the laws or regulations of any other jurisdiction with respect to any proceedings, or any successor provision of law of similar import, in the event of any bankruptcy event with respect to Settling Defendant. Specifically, in the event that the trustee (or similar official) in a bankruptcy event with respect to Settling Defendant or the debtor-in-possession takes any action (including the institution of any action, suit or other proceeding for the purpose of enforcing the rights of Settling Defendant under this Guarantee), Guarantors shall not assert any defense, claim or counterclaim denying liability hereunder on the basis that this Guarantee or the Amended Consent Decree is an executory contract or a “financial accommodation” that cannot be assumed, assigned or enforced or on any other theory directly or indirectly based on the Federal Bankruptcy Code, or equivalent provisions of the law or regulations of any other jurisdiction with respect to any proceedings or any successor provision of law of similar import. If a bankruptcy event with respect to Settling Defendant shall occur, Guarantors agree, after the occurrence of such bankruptcy event, to reconfirm in writing, to the extent permitted by applicable legal requirements and at EPA’s written request, their pre-petition waiver of any protection to which they may be entitled under the Federal Bankruptcy Code or equivalent provisions of the laws or regulations of any other jurisdiction with respect to proceedings and, to give effect to such waiver, Guarantors consent to the assumption and enforcement of each provision of this Guarantee by the debtor-in-possession or Settling Defendant’s trustee in bankruptcy, as the case may be.

5.4 Reinstatement. This Guarantee and the obligations of Guarantors hereunder shall continue to be effective or be automatically reinstated, as the case may be, if and to the extent that for any reason any payment or performance by or on behalf of Guarantors in respect of the Guaranteed Obligations is rescinded or otherwise restored to Guarantors or Settling Defendant, whether as a result of any proceedings in bankruptcy or reorganization or otherwise, all as if such payment or performance had not been made, and Guarantors agree that they will indemnify EPA on demand for all reasonable costs and expenses (including reasonable fees of counsel) incurred by EPA in connection with any such rescission or restoration.

ARTICLE VI.
MISCELLANEOUS

6.1 Obligations Secured. Without limiting the generality of the foregoing, this Guarantee secures the payment and performance when due of all Guaranteed Obligations. If, notwithstanding the representation and warranty set forth in Section 3.1.4 or anything to the contrary herein, enforcement of the liability of any Guarantor under this Guarantee for the full amount of the Guaranteed Obligations would be an unlawful or voidable transfer under any applicable fraudulent conveyance or fraudulent transfer law or any comparable law, then the liability of such Guarantor hereunder shall be reduced to the highest amount for which such liability may then be enforced without giving rise to an unlawful or voidable transfer under any such law.

6.2 Successions or Assignments. This Guarantee is binding upon Guarantors. Guarantors may not assign any of their obligations hereunder without the prior written consent of EPA (and any purported assignment in violation of this Section shall be void).

6.3 Other Waivers. No delay or omission on the part of EPA in exercising any of its rights (including those hereunder) and no partial or single exercise thereof and no action or non-action by EPA, with or without notice to Guarantors, Settling Defendant, or any other person, shall constitute a waiver of any rights or shall affect or impair this Guarantee.

6.4 Headings. The headings in this Guarantee are for convenience of reference only and shall not constitute a part of this Guarantee for any other purpose or be given any substantive effect.

6.5 Remedies Cumulative. Each and every right and remedy of EPA hereunder shall be cumulative and shall be in addition to any other right or remedy given hereunder or under the Third Amended Consent Decree, or now or hereafter existing at law or in equity.

6.6 Severability. Any provision of this Guarantee that may be determined by competent authority to be prohibited or unenforceable in any jurisdiction shall, as to such jurisdiction, be ineffective to the extent of such prohibition or unenforceability without invalidating the remaining provisions hereof, and any such prohibition or unenforceability in any jurisdiction shall not invalidate or render unenforceable such provision in any other jurisdiction.

6.7 Amendments. This Guarantee may be amended, waived or otherwise modified only with the written consent of the parties hereto, the written consent of EPA and otherwise in accordance with the terms of the Third Amended Consent Decree.

6.8 Jurisdiction. Guarantor agrees that any legal action or proceeding by or against Guarantors or with respect to or arising out of this Guarantee may be brought by the United States in or removed to the United States District Court for the Western District of Washington. By execution and delivery of this Guarantee, Guarantors accept, for themselves and in respect of their property, generally and unconditionally, the non-exclusive jurisdiction of the aforesaid court. Guarantors irrevocably consent to the service of process out of the aforementioned court in any manner permitted by law. Any such process or summons in connection with any such action or proceeding may also be served by mailing a copy thereof by certified or registered mail, or any substantially similar form of mail, addressed to Guarantors as provided for notices hereunder. Guarantors hereby waive any right to stay or dismiss any action or proceeding under or in connection with this Guarantee or the Third Amended Consent Decree brought before the foregoing court on the basis of *forum non-conveniens*. Nothing herein shall affect the right of EPA to bring legal action or proceedings in any other competent jurisdiction.

6.9 Governing Law. This Guarantee and the rights and obligations of EPA and Guarantors shall be governed by, and construed in accordance with, the law of the State of Washington without reference to principles of conflicts of law.

6.10 Integration of Terms. This Guarantee, together with the Third Amended Consent Decree, is intended by the parties as a final expression of their agreement and is intended as a complete and exclusive statement of the terms and conditions thereof.

6.11 Notices. Any communications between the parties hereto or notices provided herein to be given may be given to the following addresses:

If to Guarantors: Michael A. Cohen
5219 N. Shirley St. Suite 100Ruston, WA 98407
Telephone: (253) 752-2185
Facsimile: (253) 752-7083

And to: Kenneth J. and Kathryn Thomsen
10306 35th Lane SE
Olympia, Washington 98513

And to: Rod Brown

Kevin Rochlin, Remedial Project Manager
1200 6th Avenue, Suite 900
M/S ECL 122
Seattle, WA 98101
(206) 553-2106

All notices or other communications required or permitted to be given hereunder shall be in writing and shall be considered as properly given (a) if delivered in person, (b) if sent by overnight delivery service (including Federal Express, UPS and other similar overnight delivery services), (c) if mailed by first class United States Mail, postage prepaid, registered or certified with return receipt requested, (d) if sent by facsimile or (e) if sent via other electronic means

(including electronic mail). Notice so given shall be effective upon receipt by the addressee, except that communication or notice so transmitted by facsimile or other direct written electronic means shall be deemed to have been validly and effectively given on the day on which it is transmitted if transmitted before 4:00 p.m., recipient's time, and if transmitted after that time, on the next following Banking Day; provided, however, that (i) if any notice is tendered to an addressee and the delivery thereof is refused by such addressee, such notice shall be effective upon such tender, and (ii) with respect to any notice given via facsimile or other electronic means, the sender of such message shall promptly provide the addressee with an original copy of such notice by any of the means specified in clauses (a), (b) or (c) above. Any party shall have the right to change its address for notice hereunder to any other location within the continental United States by giving five days' notice to the other parties in the manner set forth above.

6.12 Collection Expenses. Without regard to any limitation set forth in this Guarantee, if EPA is required to pursue any remedy against Guarantors hereunder, Guarantors shall pay to EPA upon demand therefore, all reasonable attorneys' fees and all other costs and expenses incurred by EPA in enforcing this Guarantee (and such fees, costs and expenses shall be deemed to be part of the Guaranteed Obligations).

6.13 Counterparts. This Guarantee and any amendments, waivers, consents or supplements hereto or in connection herewith may be executed in any number of counterparts and by different parties hereto in separate counterparts, each of which when so executed and delivered shall be deemed an original, but all such counterparts together shall constitute one and the same agreement.

6.14 Limitations on Liability. No claim shall be made by Guarantors against EPA or any of its employees, attorneys or agents for any loss of profits, business or anticipated savings, special or punitive damages or any indirect or consequential loss whatsoever in respect of any breach or wrongful conduct (whether or not the claim therefor is based on contract, tort or duty imposed by law), in connection with, arising out of or in any way related to the transactions contemplated by this Guarantee or the Third Amended Consent Decree or any act or omission or event occurring in connection therewith; and Guarantors hereby waive, release and agree not to sue upon any such claim for any such damages, whether or not accrued and whether or not known or suspected to exist in their favor.

6.15 Time. Time is of the essence of this Guarantee.

6.16 Termination. Subject to Section 5.4, this Guarantee and all of the obligations of Guarantors hereunder shall terminate upon the earlier of (a) payment and performance in full of all Guaranteed Obligations in accordance with the Amended Consent Decree and (b) the substitution of a different financial assurance mechanism in accordance with Paragraph 62.c of the Third Amended Consent Decree as consented to in writing by EPA. Unless earlier terminated pursuant to the foregoing sentence, this Guarantee shall survive any foreclosure proceedings instituted, commenced, or completed against Settling Defendant.

6.17 Third Amended Consent Decree. Guarantors acknowledge that they have been provided with a copy of the Third Amended Consent Decree and have read and are familiar with the provisions of the Third Amended Consent Decree.

IN WITNESS WHEREOF, the parties hereto, by their authorized representatives duly authorized, intending to be legally bound, have caused this Guarantee to be duly executed and delivered as of the date first above written.

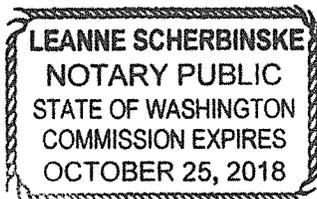

MICHAEL A. COHEN,
as Guarantor

Michael Cohen
